CONTENTS

1	Overview.....	1
1.1	Block Diagram.....	2
1.2	Features.....	3
1.2.1	CPU Core.....	3
1.2.2	Memory Sub-systems.....	3
1.2.3	System Devices.....	4
1.2.4	Audio/Display/UI Interfaces.....	4
1.2.5	On-chip Peripherals.....	5
1.2.6	Bootrom.....	6
1.3	Characteristic.....	7
2	CPU Core.....	8
2.1	Block Diagram.....	8
2.2	Extra Features of CPU core in JZ4740.....	9
2.3	Instruction Cycles.....	10
3	External Memory Controller.....	13
3.1	Overview.....	13
3.2	Pin Description.....	14
3.3	Physical Address Space Map.....	15
3.4	Static Memory Interface.....	17
3.4.1	Register Description.....	18
3.4.2	Example of Connection.....	23
3.4.3	Basic Interface.....	25
3.4.4	Byte Control.....	29
3.4.5	Burst ROM Interface.....	32
3.5	NAND Flash Interface.....	33
3.5.1	Register Description.....	33
3.5.2	NAND Flash Boot Loader.....	39
3.5.3	NAND Flash Operation.....	40
3.6	SDRAM Interface.....	44
3.6.1	Register Description.....	45
3.6.2	Refresh Time Constant Register (RTCOR).....	52
3.6.3	Example of Connection.....	54
3.6.4	Address Multiplexing.....	56
3.6.5	SDRAM Command.....	59
3.6.6	SDRAM Timing.....	60
3.6.7	Power-Down Mode.....	74
3.6.8	Refreshing.....	75
3.6.9	Initialize Sequence.....	79

3.7	Bus Control Register (BCR)	83
4	DMA Controller	84
4.1	Features	84
4.2	Register Descriptions	85
4.2.1	DMA Source Address (DSAn, n = 0 ~ 5)	86
4.2.2	DMA Target Address (DTAn, n = 0 ~ 5)	86
4.2.3	DMA Transfer Count (DTCn, n = 0 ~ 5)	87
4.2.4	DMA Request Types (DRTn, n = 0 ~ 5)	87
4.2.5	DMA Channel Control/Status (DCSn, n = 0 ~ 5)	88
4.2.6	DMA Channel Command (DCMn, n = 0 ~ 5)	89
4.2.7	DMA Descriptor Address (DDAn, n = 0 ~ 5)	91
4.2.8	DMA Control	91
4.2.9	DMA Doorbell (DDR)	92
4.2.10	DMA Interrupt Pending (DIRQP)	92
4.3	DMA manipulation	93
4.3.1	Descriptor Transfer	93
4.3.2	No-Descriptor Transfer	96
4.4	DMA Requests	97
4.4.1	Auto Request	97
4.4.2	On-Chip Peripheral Request	97
4.5	DMA Transfer Modes	98
4.5.1	Single Mode	98
4.5.2	Block Mode	98
4.6	Channel Priorities	99
4.6.1	Fixed Mode	99
4.6.2	Round Robin Mode	99
4.7	Examples	100
4.7.1	Memory-to-memory auto request No-Descriptor Transfer	100
5	Clock Reset and Power Controller	101
5.1	Overview	101
5.2	Clock Generation UNIT	102
5.2.1	Pin Description	103
5.2.2	CGU Block Diagram	104
5.2.3	Clock Overview	105
5.2.4	CGU Registers	106
5.2.5	PLL Operation	112
5.2.6	Main Clock Division Change Sequence	113
5.2.7	Change Other Clock Frequencies	114
5.2.8	Change Clock Source Selection	114
5.2.9	EXCLK Oscillator	115
5.3	Power Manager	117

5.3.1	Low-Power Modes and Function.....	117
5.3.2	Register Description.....	117
5.3.3	Doze Mode.....	120
5.3.4	IDLE Mode.....	121
5.3.5	SLEEP Mode.....	121
5.4	Reset Control Module.....	122
5.4.1	Register Description.....	122
5.4.2	Power On Reset.....	122
5.4.3	WDT Reset.....	123
6	Real-Time Clock (RTC).....	124
6.1	Overview.....	124
6.1.1	Features.....	124
6.1.2	Signal Descriptions.....	124
6.2	Register Description.....	126
6.2.1	RTC Control Register (RTCCR).....	127
6.2.2	RTC Second Register (RTCSR).....	128
6.2.3	RTC Second Alarm Register (RTCSAR).....	128
6.2.4	RTC Regulator Register (RTCGR).....	129
6.2.5	Hibernate Control Register (HCR).....	129
6.2.6	HIBERNATE mode Wakeup Filter Counter Register (HWFCR).....	130
6.2.7	Hibernate Reset Counter Register (HRCR).....	131
6.2.8	HIBERNATE Wakeup Control Register (HWCR).....	131
6.2.9	HIBERNATE Wakeup Status Register (HWRSR).....	132
6.2.10	Hibernate Scratch Pattern Register (HSPR).....	133
6.3	Time Regulation.....	134
6.3.1	HIBERNATE Mode.....	135
7	Interrupt Controller.....	136
7.1	Overview.....	136
7.2	Register Description.....	137
7.2.1	Interrupt Controller Source Register (ICSR).....	137
7.2.2	Interrupt Controller Mask Register (ICMR).....	138
7.2.3	Interrupt Controller Mask Set Register (ICMSR).....	138
7.2.4	Interrupt Controller Mask Clear Register (ICMCR).....	138
7.2.5	Interrupt Controller Pending Register (ICPR).....	139
7.3	Software Considerations.....	140
8	Timer/Counter Unit.....	141
8.1	Overview.....	141
8.2	Pin Description.....	142
8.3	Register Description.....	143
8.3.1	Timer Control Register (TCSR).....	145

8.3.2	Timer Data FULL Register (TDFR).....	146
8.3.3	Timer Data HALF Register (TDHR).....	147
8.3.4	Timer Counter (TCNT).....	147
8.3.5	Timer Counter Enable Register (TER).....	148
8.3.6	Timer Counter Enable Set Register (TESR).....	149
8.3.7	Timer Counter Enable Clear Register (TECR).....	150
8.3.8	Timer Flag Register (TFR).....	151
8.3.9	Timer Flag Set Register (TFSR).....	151
8.3.10	Timer Flag Clear Register (TFCR).....	152
8.3.11	Timer Mask Register (TMR).....	152
8.3.12	Timer Mask Set Register (TMSR).....	153
8.3.13	Timer Mask Clear Register (TMCR).....	154
8.3.14	Timer Stop Register (TSR).....	154
8.3.15	Timer Stop Set Register (TSSR).....	155
8.3.16	Timer Stop Clear Register (TSCR).....	156
8.4	Operation.....	158
8.4.1	Basic Operation.....	158
8.4.2	Disable and Shutdown Operation.....	158
8.4.3	Pulse Width Modulator (PWM).....	158
8.4.4	The flow of using TCU5.....	159
9	Watchdog Timer.....	161
9.1	Overview.....	161
9.2	Register Description.....	162
9.2.1	Watchdog Control Register (TCSR).....	162
9.2.2	Watchdog Enable Register (TCER).....	163
9.2.3	Watchdog Timer Data Register (TDR).....	164
9.2.4	Watchdog Timer Counter (TCNT).....	164
9.3	Watchdog Timer Function.....	165
10	LCD Controller.....	166
10.1	Overview.....	166
10.2	Pin Description.....	167
10.3	Block Diagram.....	168
10.4	LCD Display Timing.....	169
10.5	TV Encoder Timing.....	170
10.6	Register Description.....	171
10.6.1	Configure Register (LCDCFG).....	172
10.6.2	Vertical Synchronize Register (LCDVSYNC).....	174
10.6.3	Horizontal Synchronize Register (LCDHSYNC).....	174
10.6.4	Virtual Area Setting (LCDVAT).....	174
10.6.5	Display Area Horizontal Start/End Point (LCDDAH).....	175
10.6.6	Display Area Vertical Start/End Point (LCDDAV).....	175

10.6.7	PS Signal Setting (LCDPS).....	176
10.6.8	CLS Signal Setting (LCDCLS)	176
10.6.9	SPL Signal Setting (LCDSPL).....	177
10.6.10	REV Signal Setting (LCDREV).....	177
10.6.11	Control Register (LCDCTRL)	177
10.6.12	Status Register (LCDSTATE)	179
10.6.13	Interrupt ID Register (LCDIID).....	179
10.6.14	Descriptor Address Register0, 1 (LCDDA0, 1).....	180
10.6.15	Source Address Register0, 1 (LCDSA0, 1).....	180
10.6.16	Frame ID Register0 (LCDFID0,1).....	181
10.6.17	DMA Command Register0, 1 (LCDCMD0, 1).....	181
10.7	LCD Controller Pin Mapping	183
10.7.1	TFT and CCIR656 Pin Mapping	183
10.7.2	Single STN Pin Mapping	184
10.7.3	Dual Panel STN Pin Mapping	185
10.8	Display Timing.....	186
10.8.1	General 16-bit and 18-bit TFT Timing	186
10.8.2	8-bit Serial TFT Timing	187
10.8.3	Special TFT Timing.....	188
10.9	Format of Palette	190
10.9.1	STN	190
10.9.2	TFT.....	190
10.10	Format of Frame Buffer	191
10.10.1	16bpp.....	191
10.10.2	18bpp.....	191
10.10.3	24bpp.....	191
10.11	Format of Data Pin Utilization	192
10.11.1	Mono STN	192
10.11.2	Color STN.....	192
10.11.3	18-bit Parallel TFT	192
10.11.4	16-bit Parallel TFT	192
10.11.5	8-bit Serial TFT (24bpp)	192
10.12	LCD Controller Operation.....	194
10.12.1	Set LCD Controller Device Clock and Pixel Clock	194
10.12.2	Enabling the Controller	194
10.12.3	Disabling the Controller	194
10.12.4	Resetting the Controller.....	195
10.12.5	Frame Buffer & Palette Buffer	195
11	Smart LCD Controller	196
11.1	Overview	196
11.2	Structure.....	196
11.3	Pin Description.....	197

11.4	Register Description	198
11.4.1	SLCD Configure Register (MCFG)	198
11.4.2	SLCD Control Register (MCTRL)	200
11.4.3	SLCD Status Register (MSTATE)	200
11.4.4	SLCD Data Register (MDATA).....	201
11.4.5	SLCD FIFO (MFIFO)	201
11.5	System Memory Format	202
11.5.1	Data format	202
11.5.2	Command Format.....	203
11.6	Transfer Mode	204
11.6.1	DMA Transfer Mode	204
11.6.2	Register Transfer Mode	204
11.7	Timing	205
11.7.1	Parallel Timing	205
11.7.2	Serial Timing	205
11.8	Operation Guide	206
11.8.1	DMA Operation	206
11.8.2	Register Operation.....	206
12	Image Process Unit	207
12.1	Overview.....	207
12.2	Features	207
12.3	Block Diagram	207
12.4	Data flow.....	208
12.4.1	Input Data	208
12.4.2	Output Data.....	208
12.4.3	Resize Coefficients LUT	208
12.5	Register definition.....	209
12.5.1	IPU Control Register.....	209
12.5.2	IPU Status Register	209
12.5.3	Data Format Register	210
12.5.4	Input Y Data Address Register.....	211
12.5.5	Input U Data Address Register	211
12.5.6	Input V Data Address Register	211
12.5.7	Input Geometric Size Register.....	212
12.5.8	Input Y Data Line Stride Register	212
12.5.9	Input UV Data Line Stride Register.....	213
12.5.10	Output Frame Start Address Register	213
12.5.11	Output Geometric Size Register	213
12.5.12	Output Data Line Stride Register	214
12.5.13	Resize Coefficients Table Index Register	214
12.5.14	CSC C0 Coefficient Register	215
12.5.15	CSC C1 Coefficient Register	215

12.5.16	CSC C2 Coefficient Register	216
12.5.17	CSC C3 Coefficient Register	216
12.5.18	CSC C4 Coefficient Register	217
12.5.19	Horizontal Resize Coefficients Look Up Table Register group	217
12.5.20	Vertical Resize Coefficients Look Up Table Register group	220
12.6	Calculation for Resized width and height	221
12.7	IPU Initialization Flow	222
13	Internal CODEC	227
13.1	Overview	227
13.1.1	Features	227
13.1.2	Signal Descriptions	227
13.1.3	Block Diagram	228
13.2	Register Descriptions	230
13.2.1	CODEC Control Register 1 (CDCCR1)	230
13.2.2	CODEC Control Register 2 (CDCCR2)	232
13.3	Operation	234
13.3.1	Initialization	234
13.3.2	CODEC controlling and typical operations	234
13.3.3	Power saving	237
13.3.4	Pop noise and the reduction of it	238
13.4	Timing parameters	243
13.5	AC & DC parameters	243
14	AC97/I2S Controller	244
14.1	Overview	244
14.1.1	Block Diagram	245
14.1.2	Features	245
14.1.3	Interface Diagram	246
14.1.4	Signal Descriptions	247
14.1.5	RESET# / SYS_CLK Pin	247
14.1.6	BIT_CLK Pin	248
14.1.7	SYNC Pin	248
14.1.8	SDATA_OUT Pin	248
14.1.9	SDATA_IN Pin	248
14.2	Register Descriptions	249
14.2.1	AIC Configuration Register (AICFR)	250
14.2.2	AIC Common Control Register (AICCR)	252
14.2.3	AIC AC-link Control Register 1 (ACCR1)	254
14.2.4	AIC AC-link Control Register 2 (ACCR2)	255
14.2.5	AIC I2S/MSB-justified Control Register (I2SCR)	257
14.2.6	AIC Controller FIFO Status Register (AICSR)	257
14.2.7	AIC AC-link Status Register (ACSR)	259

14.2.8	AIC I2S/MSB-justified Status Register (I2SSR).....	260
14.2.9	AIC AC97 CODEC Command Address & Data Register (ACCAR, ACCDR).....	261
14.2.10	AIC AC97 CODEC Status Address & Data Register (ACSAR, ACSDR).....	261
14.2.11	AIC I2S/MSB-justified Clock Divider Register (I2SDIV).....	262
14.2.12	AIC FIFO Data Port Register (AICDR).....	263
14.3	Serial Interface Protocol.....	264
14.3.1	AC-link serial data format.....	264
14.3.2	I2S and MSB-justified serial audio format.....	265
14.3.3	Audio sample data placement in SDATA_IN/SDATA_OUT.....	266
14.4	Operation.....	268
14.4.1	Initialization.....	268
14.4.2	AC '97 CODEC Power Down.....	269
14.4.3	Cold and Warm AC '97 CODEC Reset.....	269
14.4.4	External CODEC Registers Access Operation.....	271
14.4.5	Audio Replay.....	271
14.4.6	Audio Record.....	272
14.4.7	FIFOs operation.....	274
14.4.8	Data Flow Control.....	275
14.4.9	Serial Audio Clocks and Sampling Frequencies.....	276
14.4.10	Interrupts.....	280
15	SAR A/D Controller.....	281
15.1	Overview.....	281
15.2	Pin Description.....	282
15.3	Register Description.....	283
15.3.1	ADC Enable Register (ADENA).....	284
15.3.2	ADC Configure Register (ADCFG).....	285
15.3.3	ADC Control Register (ADCTRL).....	287
15.3.4	ADC Status Register (ADSTATE).....	288
15.3.5	ADC Same Point Time Register (ADSAME).....	289
15.3.6	ADC Wait Pen Down Time Register (ADWAIT).....	289
15.3.7	ADC Touch Screen Data Register (ADTCH).....	289
15.3.8	ADC PBAT Data Register (ADBDAT).....	292
15.3.9	ADC SADCIN Data Register (ADSDAT).....	293
15.4	SAR A/D Controller Guide.....	294
15.4.1	Single Operation (internal used only).....	294
15.4.2	A simple Touch Screen Operation.....	294
15.4.3	PBAT Sample Operation.....	295
15.4.4	SADCIN Sample Operation.....	295
15.4.5	Use TSC to support keypad.....	296
16	General-Purpose I/O Ports.....	300
16.1	Overview.....	300

16.2	Register Description.....	307
16.2.1	PORT PIN Level Register (PAPIN, PBPIN, PCPIN, PDPIN)	310
16.2.2	PORT Data Register (PADAT, PBDAT, PCDAT, PDDAT).....	310
16.2.3	PORT Data Set Register (PADATS, PBDATS, PCDATS, PDDATS).....	311
16.2.4	PORT Data Clear Register (PADATC, PBDATC, PCDATC, PDDATC).....	311
16.2.5	PORT Mask Register (PAIM, PBIM, PCIM, PDIM)	312
16.2.6	PORT Mask Set Register (PAIMS, PBIMS, PCIMS, PDIMS)	312
16.2.7	PORT Mask Clear Register (PAIMC, GBPIMC, PCIMC, PDIMC).....	313
16.2.8	PORT PULL Disable Register (PAPE, PBPE, PCPE, PDPE).....	313
16.2.9	PORT PULL Set Register (PAPES, PBPE, PCPE, PDPE).....	314
16.2.10	PORT PULL Clear Register (PAPEC, PBPEC, PCPEC, PDPEC).....	314
16.2.11	PORT Function Register (PAFUN, PBFUN, PCFUN, PDFUN).....	315
16.2.12	PORT Function Set Register (PAFUNS, PBFUNS, PCFUNS, PDFUNS).....	315
16.2.13	PORT Function Clear Register (PAFUNC, PBFUNC, PCFUNC, PDFUNC).....	316
16.2.14	PORT Select Register (PASEL, PBSEL, PCFSEL, PDSEL).....	316
16.2.15	PORT Select Set Register (PASELS, PBSELS, PCSELS, PDSELS).....	317
16.2.16	PORT Select Clear Register (PASELC, PBSELC, PCSELC, PDSELC).....	317
16.2.17	PORT Direction Register (PADIR, PBDIR, PCDIR, PDDIR).....	318
16.2.18	PORT Direction Set Register (PADIRS, PBDIRS, PCDIRS, PDDIRS).....	318
16.2.19	PORT Direction Clear Register (PADIRC, PBDIRC, PCDIRC, PDDIRC).....	319
16.2.20	PORT Trigger Register 0, 1, 2 and 3 (PATRG, PBTRG, PCTRG, PDTRG).....	319
16.2.21	PORT Trigger Set Register (PATRGS, PBTRGS, PCTRGS, PDTRGS).....	320
16.2.22	PORT Trigger Clear Register (PATRGC, PBTRGC, PCTRGC, PDTRGC).....	320
16.2.23	PORT FLAG Register (PAFLG, PBFLG, PCFLG, PDFLG).....	321
16.2.24	PORT FLAG Clear Register (PAFLGC, PBFLGC, PCFLGC, PDFLGC).....	321
16.3	Program Guide.....	322
16.3.1	GPIO Function Guide	322
16.3.2	Alternate Function Guide.....	322
16.3.3	Interrupt Function Guide.....	322
16.3.4	Disable Interrupt Function Guide	322
17	I2C Bus Interface	323
17.1	Overview	323
17.2	Pin Description.....	324
17.3	Register Description.....	325
17.3.1	Data Register (I2CDR)	325
17.3.2	Control Register (I2CCCR).....	325
17.3.3	Status Register (I2CSR).....	326
17.3.4	Clock Generator Register (I2CGR)	326
17.4	I ² C-Bus Protocol.....	328
17.4.1	Bit Transfer	328
17.4.2	Data Validity.....	328
17.4.3	START and STOP Conditions	328

17.4.4	Byte Format	328
17.4.5	Data Transfer Format.....	330
17.5	I2C Operation	334
17.5.1	I2C Initialization.....	334
17.5.2	Write Operation.....	335
17.5.3	Read Operation.....	336
18	USB 2.0 Device Controller	338
18.1	Overview.....	338
18.2	Feature	338
18.3	Functional Description.....	339
18.3.1	Block Diagram.....	339
18.3.2	Block Description	339
18.4	Register Description	341
18.4.1	Register Map.....	341
18.4.2	Memory Map	342
18.4.3	Registers Summary	343
18.5	Programming Scheme.....	363
18.5.1	SOFT CONNECT/DISCONNECT.....	363
18.5.2	USB INTERRUPT HANDLING	363
18.6	USB RESET	365
18.7	SUSPEND/RESUME.....	366
18.7.1	ACTIVE DURING SUSPEND	366
18.7.2	INACTIVE DURING SUSPEND.....	366
18.7.3	REMOTE WAKEUP	366
18.8	ENDPOINT 0 HANDLING	367
18.8.1	ZERO DATA REQUESTS	367
18.8.2	WRITE REQUESTS	368
18.8.3	READ REQUESTS	369
18.8.4	END POINT0 STATES.....	369
18.8.5	END POINT0 SERVICER OUTINE	371
18.8.6	IDLE MODE	373
18.8.7	TX MODE.....	373
18.8.8	RX MODE	374
18.8.9	ERROR HANDLING	375
18.9	BULK TRANSACTIONS.....	377
18.9.1	BULK IN ENDPOINT	377
18.9.2	BULK OUT ENDPOINT	379
18.9.3	INTERRUPT TRANSACTIONS	383
18.10	TRANSACTION FLOWS	385
18.10.1	CONTROL TRANSACTIONS	385
18.10.2	BULK/INTERRUPT TRANSACTIONS.....	390
18.10.3	DMA OPERATIONS (WITH BUI LT- IN DMA CONTROLLE).....	392

18.11	TESTMODES	397
18.11.1	TESTMODETEST_SE0_NAK	397
18.11.2	TESTMODETEST_J	397

1 Overview

JZ4725 is a cost effective SOC solution for multimedia rich and mobile devices like video MP3, MP4 and PMP like products.

At the heart of JZ4725 is XBurst CPU core. XBurst is an industry leading microprocessor core which delivers superior high performance and best-in-class low power consumption.

The SIMD instruction set implemented by XBurst core, in together with the video post processing unit, provides RMVB, MPEG-1/2/4 decoding capability up to D1 resolution.

The memory interface of JZ4725 supports a variety of memory types that allow flexible design requirements, including glueless connection to SLC NAND flash memory or 4-bit ECC MLC NAND flash memory for cost sensitive applications.

On-chip modules such as LCD controller, audio CODEC, 2-channel SAR-ADC and AC97/I2S controller offer designers a rich suite of peripherals for multimedia application.

1.1 Block Diagram

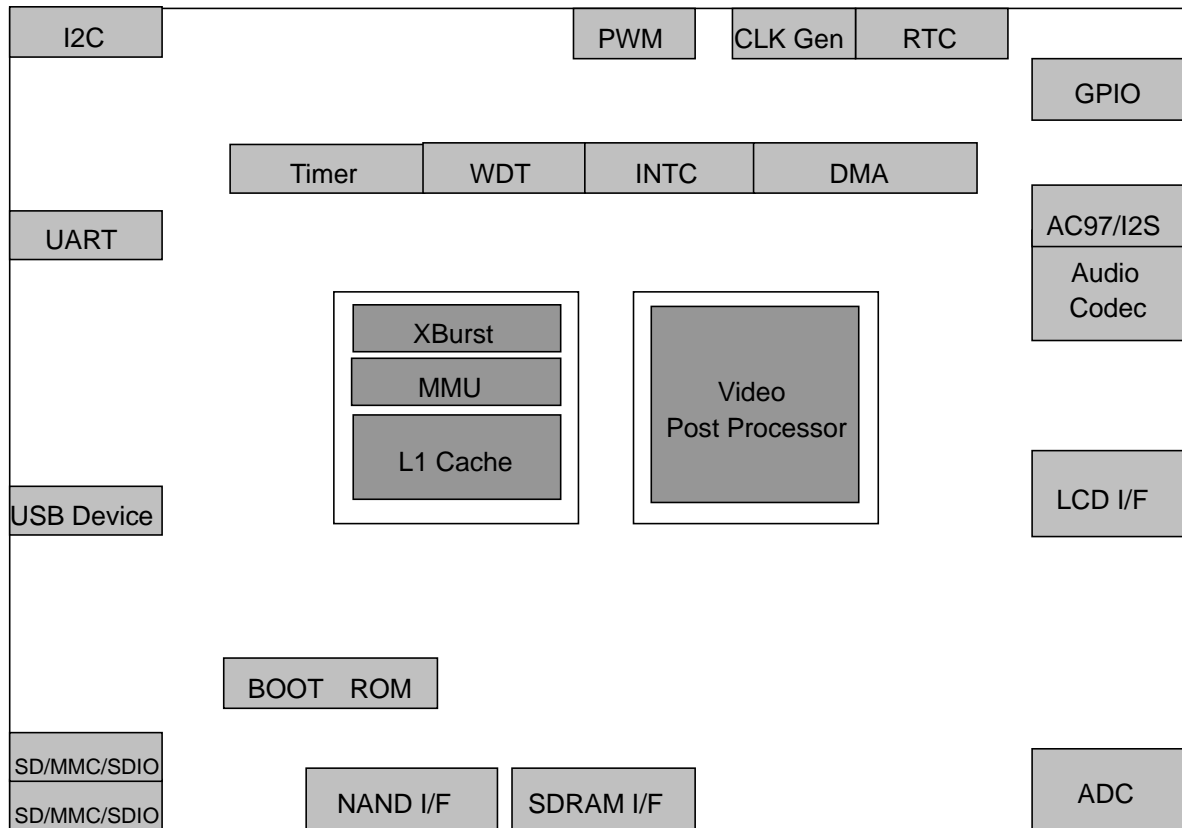

Figure 1-1 JZ4725 Diagram

1.2 Features

1.2.1 CPU Core

- XBurst CPU
 - XBurst[®] RISC instruction set to support Linux and WinCE
 - XBurst[®] SIMD instruction set to support multimedia acceleration
 - XBurst[®] 8-stage pipeline micro-architecture up to 360MHz
- MMU
 - 32-entry dual-pages joint-TLB
 - 4 entry Instruction TLB
 - 4 entry data TLB
- Cache
 - 16K instruction cache
 - 16K data cache
- Hardware debug support

1.2.2 Memory Sub-systems

- NAND flash interface
 - Support MLC NAND as well as SLC NAND
 - Support all 8-bit/16-bit NAND Flash devices regardless of density and organization
 - Hamming Hardware ECC for 2 bit errors detection and 1 bit error correction
 - Reed-Solomon Hardware ECC for 4 9-bit-symbol errors detection and correction
 - Support automatic boot up from NAND Flash devices
 - Two chip select
- Synchronous DRAM interface
 - 1 banks with programmable size and base address
 - 16-bit data bus width
 - Multiplexes row/column addresses according to SDRAM capacity
 - Two-bank or four-bank SDRAM is supported
 - Supports auto-refresh and self-refresh functions
 - Supports power-down mode to minimize the power consumption of SDRAM
 - Supports page mode
- Direct memory access controller
 - Six independent DMA channels
 - Descriptor supported
 - Transfer data units: 8-bit, 16-bit, 32-bit, 16-byte or 32-byte
 - Transfer requests can be: auto-request within DMA; and on-chip peripheral module request
 - Interrupt on transfer completion or transfer error
 - Supports two transfer modes: single mode or block mode
- The XBurst processor system supports little endian only

1.2.3 System Devices

- Clock generation and power management
 - On-chip oscillator circuit for an 32768Hz clock and an 12MHz clock
 - On-chip phase-locked loops (PLL) with programmable multiple-ratio. Internal counter are used to ensure PLL stabilize time
 - PLL on/off is programmable by software
 - ICLK, PCLK, SCLK, MCLK and LCLK frequency can be changed separately for software by setting division ratio
 - Supports six low-power modes and function: NORMAL mode; DOZE mode; IDLE mode; SLEEP mode; HIBERNATE mode; and MODULE-STOP function
- RTC (Real Time Clock)
 - 32-bit second counter
 - 1Hz from 32768hz
 - Alarm interrupt
 - Independent power
 - A 32-bits scratch register used to indicate whether power down happens for RTC power
- Interrupt controller
 - Total 28 maskable interrupt sources from on-chip peripherals and external request through GPIO ports
 - Interrupt source and pending registers for software handling
 - Unmasked interrupts can wake up the chip in sleep or standby mode
- Timer and counter unit with PWM output
 - Provide five separate channels
 - 16-bit A counter and 16-bit B counter with auto-reload function every channel
 - Support interrupt generation when the A counter underflows
 - Three clock sources: RTCLK (real time clock), EXCLK (external clock input), PCLK (APB Bus clock) selected with 1, 4, 16, 64, 256 and 1024 clock dividing selected
 - PWM output supported
- Watchdog timer
 - 16-bit counter in RTC clock with 1, 4, 16, 64, 256 and 1024 clock dividing selected
 - Generate power-on reset

1.2.4 Audio/Display/UI Interfaces

- LCD controller
 - Single-panel display in active mode, and single- or dual-panel displays in passive mode
 - 2, 4, 16 greyscales and up to 4096 colors in STN mode
 - 2, 4, 16, 256, 4K, 32K, 64K, 256K and 16M colors in TFT mode
 - 18 bit data bus support 1,2,4,8 pins STN panel, 16bit and 18bit TFT and 8bit I/F TFT
 - Display size up to 800×600 pixels
 - 256×16 bits internal palette RAM
 - Support ITU601/656 data format
 - Support smart LCD (SRAM-like interface LCD module)

- Image Processing Unit
 - Video frame resize
 - Color space conversion: 420/444/422 YUV to RGB convert
- On-chip audio CODEC
 - 18-bit DAC, SNR: 88dB
 - 16-bit ADC, SNR: 85dB
 - Sample rate: 8/11.025/12/16/22.05/24/32/44.1/48kHz
 - L/R channels line input
 - MIC input
 - L/R channels headphone output amplifier support up to 32ohm load
- AC97/I2S controller
 - Supports 8, 16, 18, 20 and 24 bit for sample for AC-link and I2S/MSB-Justified format
 - DMA transfer mode support
 - Support variable sample rate mode for AC-link format
 - Power down mode and two wake-up mode support for AC-link format
 - Programmable Interrupt function support
 - Support the on-chip CODEC
- SADC
 - 12-bit, 2Mbps, SNR@500kHz is 61dB, THD@500kHz is -71dB
 - Battery voltage input
 - 1 generic input Channel

1.2.5 On-chip Peripherals

- General-Purpose I/O ports
 - Total GPIO pin number is 81
 - Each pin can be configured as general-purpose input or output or multiplexed with internal chip functions
 - Each pin can act as a interrupt source and has configurable rising/falling edge or high/low level detect manner, and can be masked independently
 - Each pin can be configured as open-drain when output
 - Each pin can be configured as internal resistor pull-up
- I2C bus interface
 - Only supports single master mode
 - Supports I2C standard-mode and F/S-mode up to 400 kHz
 - Double-buffered for receiver and transmitter
 - Supports general call address and START byte format after START condition
- USB 2.0 device interface
 - Compliant with USB protocol revision 2.0
 - High speed and full speed supported
 - Embedded USB 2.0 PHY
- MMC/SD/SDIO controller
 - Compliant with “The MultiMediaCard System Specification version 3.3”

- Compliant with “SD Memory Card Specification version 1.01” and “SDIO Card Specification version 1.0” with 1 command channel and 1 data channels
- 5~20 Mbps maximum data rate
- Maskable hardware interrupt for SD I/O interrupt, internal status, and FIFO status
- UART
 - 5, 6, 7 or 8 data bit operation with 1 or 1.5 or 2 stop bits, programmable parity (even, odd, or none)
 - 16x8bit FIFO for transmit and 16x11bit FIFO for receive data
 - Interrupt support for transmit, receive (data ready or timeout), and line status
 - Supports DMA transfer mode
 - Provide complete serial port signal for modem control functions
 - Support slow infrared asynchronous interface (IrDA)
 - IrDA function up to 115200bps baudrate
 - UART function up to 921.6Kbps baudrate

1.2.6 Bootrom

- 8kB Boot ROM

1.3 Characteristic

Item	Characteristic
Process Technology	0.18um CMOS
Power supply voltage	I/O: $3.3 \pm 0.3V$ Core: 1.8 ± 0.2
Package	LQFP 128 14mm * 14mm
Operating frequency	360MHz

2 CPU Core

CPU core in JZ4740 implements the Xburst-1 core. Moreover, an extra MXU (media extension unit) implements XBurst SIMD instruction set release I. Refer to following diagram for structure of the CPU core in JZ4740.

2.1 Block Diagram

Figure 2-1 CPU Core in JZ4740

2.2 Extra Features of CPU core in JZ4740

Item	Features
Media Extension Unit (MXU)	<ul style="list-style-type: none">• Ingenic SIMD instruction set release I• fully pipelined
Processor ID	Value read from CP0.PRIId is 0x0ad0024f

Please refer to documents XBurst-ISA and XBurst1_PM for ISA and programming relative details.

2.3 Instruction Cycles

Most instructions have one cycle repeat rate, that is, when the pipeline is fully filled, there is one instruction issued per clock cycle. However, some particular instructions require extra cycles. Following table lists cycle consumption of all instructions belonging to Xburst-ISA implemented in JZ4740.

1 st Instruction	2 nd Instruction	Cycles	Description
WAIT	Anyone	variable	WAIT instruction will be repeatedly executed until an interrupt arise.
MTC0 TLBWI/TLBWR TLBP/TLBR	Anyone	4	3 extra interlock cycles.
CACHE	Anyone	2	1 extra interlock cycles.
JMP/BC	Anyone (delay slot)	4/1	0 cycle penalty when BTB predicts taken and the branch is taken or BTB predicts untaken and the branch is untaken or BTB miss and the branch is untaken. Otherwise, extra 3 cycles penalty.
BCL	Anyone (delay slot)	5/4/2/1	0 cycle penalty when BTB predicts taken and branch is taken, otherwise: 1 BTB miss, branch is taken, 3 cycles penalty. 2 BTB miss, branch is untaken, 1 cycle penalty. 3 BTB predict taken, branch is untaken, 4 cycles penalty. 4 BTB predict untaken, branch is taken, 3 cycles penalty.
MULT/MULTU MADD/MADDU MSUB/MSUBU	MULT/MULTU MADD/MADDU MSUB/MSUBU	4	3 extra interlock cycles due to MDU operating hazard.
	MUL/DIV/DIVU	4	3 extra interlock cycles due to MDU operating hazard.
	MFHI/MFLO MTHI/MTLO	4	3 extra interlock cycles due to MDU operating hazard.
	Any other	1	No data dependency or hazards exist.
MUL	MULT/MULTU MADD/MADDU MSUB/MSUBU	4	3 extra interlock cycles due to MDU operating hazard.
	MUL/DIV/DIVU	4	3 extra interlock cycles due to MDU operating hazard.
	MFHI/MFLO MTHI/MTLO	4	3 extra interlock cycles due to MDU operating hazard.

	Any other	4/1	If the second instruction has RAW data dependency, 3 extra interlock cycles, otherwise, 0 cycle penalty.
DIV/DIVU	MULT/MULTU MADD/MADDU MSUB/MSUBU MUL/DIV/DIVU	4~35	3~34 extra interlock cycles determined by characteristic value of divider and dividend.
DIV/DIVU	MFHI/MFLO	2~34	1~33 interlock cycles determined by characteristic value of divider and dividend.
	Any other	1	No data dependency or hazards exist.
MFHI/MFLO/MFC0	Anyone	4/1	If the second instruction has RAW data dependency, 3 extra interlock cycles, otherwise, 0 cycle penalty.
LW/LL LWL/LWR LB/LBHU LH/HU	Anyone	4/1	If the second instruction has RAW data dependency, 3 extra interlock cycles, otherwise, 0 cycle penalty.
D16MUL/D16MULF D16MAC/D16MACF	SIMD instruction	3/1	If the second SIMD instruction has RAW data dependency, 2 extra interlock cycles, otherwise, 0 cycle penalty.
	Any other	1	No data dependency or hazards exist.
D32ACC/Q16ACC Q8SAD S32MAX/S32MIN D16MAX/D16MIN	SIMD instruction	2/1	If the second SIMD instruction has RAW data dependency, 1 extra interlock cycle, otherwise, 0 cycle penalty.
	Any other	1	No data dependency or hazards exist.
S32LDD/S32LDDV S32LDI/S32LDIV	SIMD instruction	2/1	If the second SIMD instruction has RAW data dependency, 1extra interlock cycle, otherwise, 0 cycle penalty.
	Any other	1	No data dependency or hazards exist.
S32I2M	SIMD instruction	2/1	If the second SIMD instruction has RAW data dependency, 1extra interlock cycle, otherwise, 0 cycle penalty.
	Any other	1	No data dependency or hazards exist.
S32M2I	Anyone	4/1	If the second instruction has RAW data dependency, 3 extra interlock cycles, otherwise, 0 cycle penalty.
Others	Anyone	1	

NOTE: JMP denotes J and JR instructions; BC denotes branch conditionally instructions; BCL denotes branch conditionally and likely instructions.

3 External Memory Controller

3.1 Overview

The External Memory Controller (EMC) divides the off-chip memory space and outputs control signals complying with specifications of various types of memory and bus interfaces. It enables the connection of static memory, NAND flash memory, synchronous DRAM, etc., to this processor.

- Static memory interface
 - Direct interface to ROM, Burst ROM, SRAM and NOR Flash
 - Support 4 external chip selection CS4~1#. Each bank can be configured separately
 - The size and base address of static memory banks are programmable
 - Output of control signals allowing direct connection of memory to each bank. Write strobe setup time and hold time periods can be inserted in an access cycle to enable connection to low-speed memory
 - Wait state insertion can be controlled by program
 - Wait insertion by WAIT pin
 - Automatic wait cycle insertion to prevent data bus collisions in case of consecutive memory accesses to different banks, or a read access followed by a write access to the same bank
- NAND flash interface
 - Support on CS4~CS1, sharing with static memory bank4~bank1
 - Support most types of NAND flashes, including 8-bit and 16-bit bus width, 512B and 2KB page size. For 512B page size, 3 and 4 address cycles are supported. For 2KB page size, 4 and 5 address cycles are supported
 - Hardware ECC generation including Hamming and RS codes correction
 - Support read/erase/program NAND flash memory
 - Support boot from NAND flash
- SDRAM Interface
 - Support 1 chip selection DCS#
 - Support both 32-bit and 16-bit bus width
 - Support both two-bank and four-bank type SDRAM
 - Support burst operation
 - Support both auto-refresh and self-refresh functions
 - The size and base address of each bank is configurable
 - Multiplexes row/column addresses according to SDRAM capacity
 - Controls timing of SDRAM direct-connection control signals according to register setting
 - Supports power-down mode to minimize the power consumption of SDRAM
 - Support page mode

3.2 Pin Description

Following table list the EMC pins.

Table 3-1 EMC Pin Description

Pin Name	I/O	Signal	Description
Data Bus	I/O	D31 – D0	Data I/O.
Address bus	O	A22–A0	Address output.
Static chip select 4 ~ 1	O	CS4~1#	Chip select signal that indicates the static bank being accessed.
SDRAM chip select	O	DCS#	Chip select signal that indicates the SDRAM bank being accessed.
Read enable	O	RD# /	For Static memory read enable signal.
Write enable	O	WE# /	Static memory write enable signal.
Column address strobe	O	CAS#	SDRAM column address strobe signal.
Row address strobe	O	RAS#	SDRAM row address strobe signal.
Read/write	O	RD/WR#	Data bus direction designation signal. Also used as SDRAM write enable signal.
Byte enable 0	O	WE0# / BE0# / DQM0 /	For non-byte-control static memory, D7-0 write enable signal. For byte-control static memory, D7-0 selection signal. For SDRAM, D7–D0 selection signal.
Byte enable 1	O	WE1# / BE1# / DQM1/	For non-byte-control static memory, D15-8 write enable signal. For byte-control static memory, D15-8 selection signal. For SDRAM, D15–D8 selection signal.
Byte enable 2	O	WE2# / BE2# / DQM2 /	For non-byte-control static memory, D23-16 write enable signal. For byte-control static memory, D23-16 selection signal. For SDRAM, D23–D16 selection signal.
Byte enable 3	O	WE3# / BE3# / DQM3	For static memory, D31-24 write enable signal. For byte-control static memory, D31-24 selection signal. For SDRAM, D31–D24 selection signal.
SDRAM Clock enable	O	CKE	Enable the SDRAM clock.
Wait	I	Wait# /	External wait state request signal for memory-like devices.
NAND flash read enable	O	FRE#	NAND flash read enable signal.
NAND flash write enable	O	FWE#	NAND flash write enable signal.
NAND flash ready/busy	I	FRB#	Indicates NAND flash is ready or busy. (When Nand flash boot, GPC30 is used as FRB# of CS1#)

3.3 Physical Address Space Map

Both virtual spaces and physical spaces are 32-bit wide in this architecture. Virtual addresses are translated by MMU into physical address which is further divided into several partitions for static memory, SDRAM, and internal I/O.

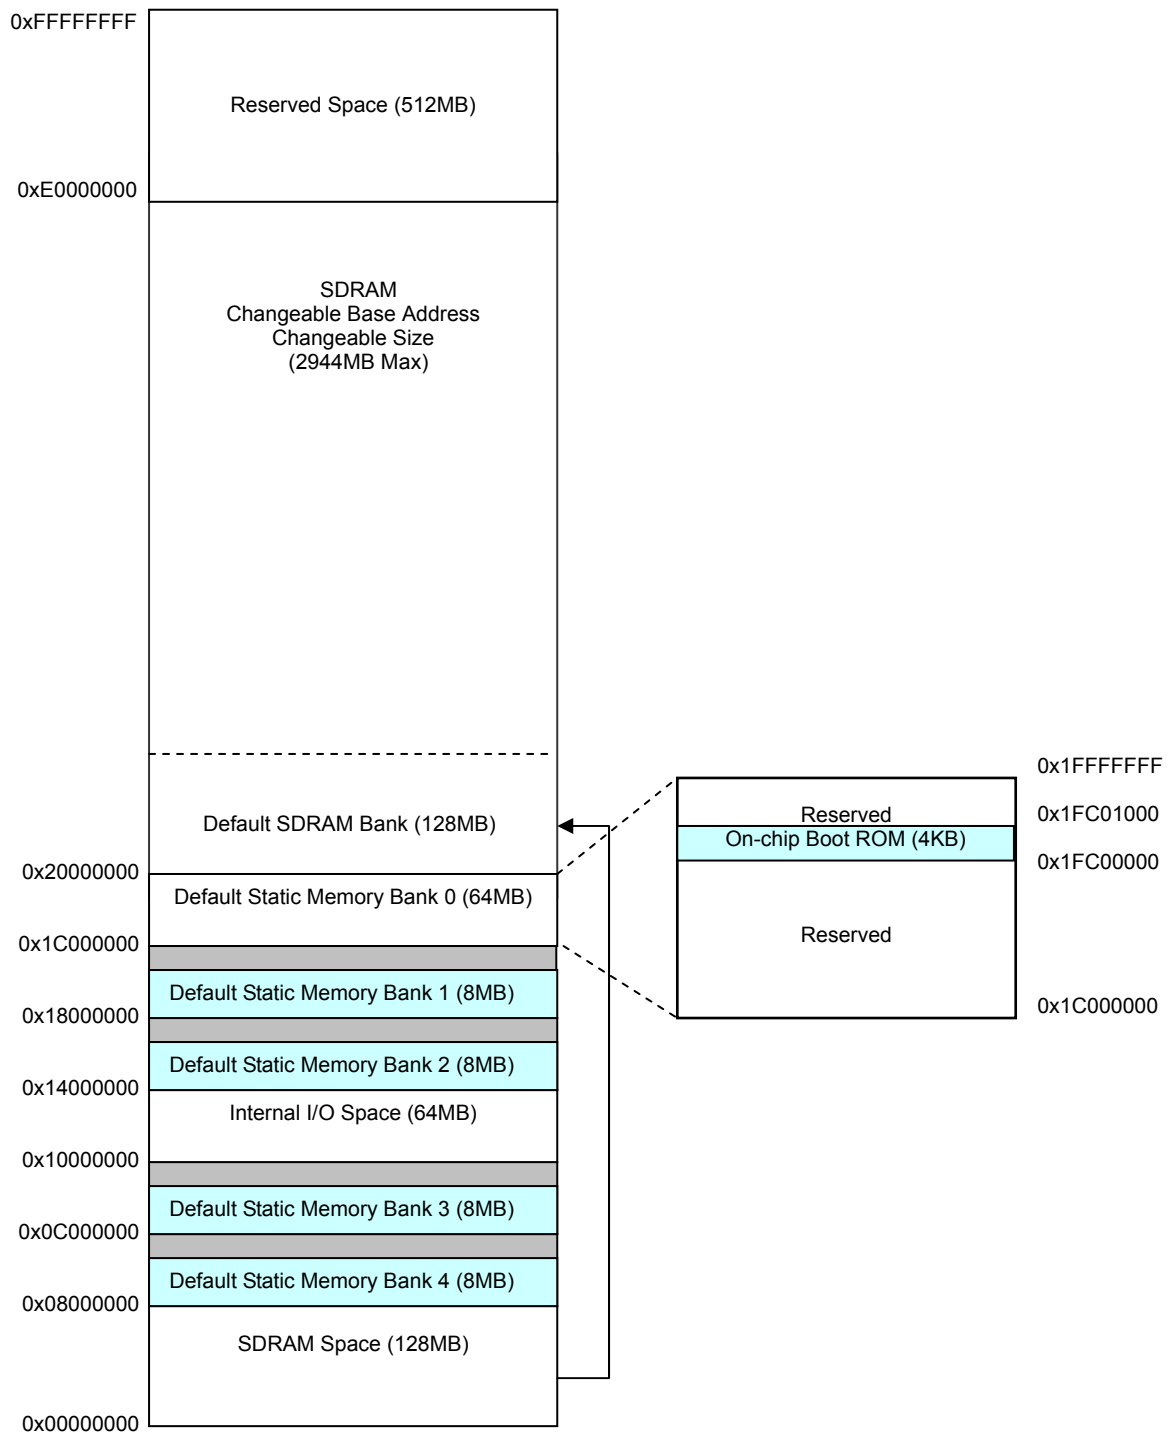

Figure 3-1 Physical Address Space Map

Table 3-2 Physical Address Space Map

Start Address	End Address	Connectable Memory	Capacity
H'0000 0000	H'07FF FFF	SDRAM space	128 MB
H'0800 0000	H'0FFF FFFF	Static memory space	128 MB
H'1000 0000	H'13FF FFFF	Internal I/O space	64 MB
H'1400 0000	H'1BFF FFFF	Static memory space	128MB
H'1C00 0000	H'1FBF FFFF	Un-used	60MB
H'1FC0 0000	H'1FC0 0FFF	On-chip boot ROM	4KB
H'1FC0 1000	H'1FFF FFFF	Un-used	4095KB
H'2000 0000	H'BFFF FFFF	SDRAM space	2944 MB
H'D000 0000	H'FFFF FFFF	Reserved space	512 MB

The base address and size of each memory banks are configurable. Software can re-configure these memory banks according to the actual connected memories. Following table lists the default configuration after reset.

Table 3-3 Default Configuration of EMC Chip Select Signals

Chip-Select Signal	Connected Memory	Capacity	Memory Width ^{*1}	Start Address	End Address
CS1#	Static memory bank 1	8 MB	8, 16, 32	H'1800 0000	H'1BFF FFFF
CS2#	Static memory bank 2	8 MB	8, 16, 32	H'1400 0000	H'17FFFFFFF
CS3#	Static memory bank 3	8 MB	8, 16, 32	H'0C00 0000	H'0FFF FFFF
CS4#	Static memory bank 4	8 MB	8, 16, 32	H'0800 0000	H'0BFF FFFF
DCS# ^{*3}	SDRAM bank	128 MB	16, 32	H'2000 0000	H'27FF FFFF

NOTES:

- 1 Data width of static memory banks can be configured to 8, 16 or 32 bits by software.
- 2 The 4KB address space from H'1FC00000 to H'1FC00FFF in bank 0 is mapped to on-chip boot ROM. The other memory spaces in bank 0 are not used.
- 3 To support large SDRAM space, EMC re-maps the physical address H'00000000-H'07FFFFFFF to H'20000000-H'27FFFFFFF. Software must configure the SDRAM base address by the re-mapped address.

3.4 Static Memory Interface

The static memory controller provides a glueless interface to SRAM's, ROMs (PROMs/EPROMs/FLASH), dual port memory, IO devices, and many other peripherals devices. It can directly control up to 4 devices using four chip select lines. Additional devices may be supported through external decoding of the address bus. The Device Controller shares the data and address busses with the SDRAM controller. Thus, only one memory subsection (SDRAM, memory, or IO) can be active at any time.

Each chip select can directly access memory or IO devices that are 8-bits, 16-bits, or 32-bits wide. Each device connected to a chip select line has 2 associated registers that control its operation and the access timing to the external device. The Static Memory Control Register SMCRn specifies various configurations for the device. The Static Memory Address Configuration Register SACRn specifies the base address and size for each device, enabling any device to be located anywhere in the physical address range.

The static memory interface includes the following signals:

- Four chip selects, CS4~1#
- Twenty-three address signals, A22-A0
- One read enable, RD#
- One write enable, WE#
- Four byte enable, BE3~1#
- One wait pin, WAIT#

The SMT field in SMCRn registers specifies the type of memory and BW field specifies the bus width. BOOT_SEL[1:0] defines whether system boot from Nor or Nand flash and the page size when boot from Nand flash.

3.4.1 Register Description

Table 3-4 Static Memory Interface Registers

Name	Description	RW	Reset Value	Address	Access Width
SMCR1	Static memory control register 1	RW	0x0FFF7700	0x13010014	32
SMCR2	Static memory control register 2	RW	0x0FFF7700	0x13010018	32
SMCR3	Static memory control register 3	RW	0x0FFF7700	0x1301001C	32
SMCR4	Static memory control register 4	RW	0x0FFF7700	0x13010020	32
SACR1	Static memory bank 1 address configuration register	RW	0x000018FC	0x13010034	32
SACR2	Static memory bank 2 address configuration register	RW	0x000016FE	0x13010038	32
SACR3	Static memory bank 3 address configuration register	RW	0x000014FE	0x1301003C	32
SACR4	Static memory bank 4 address configuration register	RW	0x00000CFC	0x13010040	32

3.4.1.1 Static Memory Control Register (SMCR1~4)

SMCR1~4 are 32-bit read/write registers that contain control bits for static memory. On reset, SMCR1~4 are initialized to 0x0FFF7700.

SMCR1	0x13010014
SMCR2	0x13010018
SMCR3	0x1301001C
SMCR4	0x13010020

2:1	BL	Burst Length (BL1, BL0): When Burst ROM is connected; these bits specify the number of burst in an access. These bits are only valid when SMT is set to 1. BL1~0 Burst Length 00 4 consecutive accesses. Can be used with 8-, 16-, or 32-bit bus width (Initial Value). 01 8 consecutive accesses. Can be used with 8-, 16-, or 32-bit bus width 10 16 consecutive accesses. Can only be used with 8- or 16-bit bus width. Do not specify for 32-bit bus width 11 32 consecutive accesses. Can only be used with 8-bit bus width	

0	SMT	Static Memory Type (SMT): This bit specifies the type of static memory. <table><thead><tr><th>SMT</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>Normal Memory (Initial Value)</td></tr><tr><td>1</td><td>Burst ROM</td></tr></tbody></table>	SMT	Description	0	Normal Memory (Initial Value)	1	Burst ROM	RW
SMT	Description								
0	Normal Memory (Initial Value)								
1	Burst ROM								

3.4.1.2 Static Bank Address Configuration Register (SACR1~4)

SACR1~4 defines the physical address for static memory bank 1 to 4, respectively. Each register contains a base address and a mask. When the following equation is met:

$$(physical_address [31:24] \& MASK_n) == BASE_n$$

The bank n is active. The *physical_address* is address output on internal system bus. Static bank regions must be programmed so that each bank occupies a unique area of the physical address space. Bank 0 base address must be 0 because it's system boot address. Programming overlapping bank regions will result in unpredictable error. These registers are initialized by a reset.

SACR1 0x13010034
SACR2 0x13010038
SACR3 0x1301003C
SACR4 0x13010040

Bits	Name	Description	RW
31:16	Reserved	Writes to these bits have no effect and read always as 0.	R
15:8	BASE	Address Base: Defines the base address of Static Bank n (n = 1 to 4). The initial values are: SACR1.BASE 0x18 SACR2.BASE 0x14 SACR3.BASE 0x0C SACR4.BASE 0x08	RW
23:20	MASK	Address Mask: Defines the mask of Static Bank n (n = 1 to 4). The initial values are: SACR1.MASK 0xFC SACR2.MASK 0xFC SACR3.MASK 0xFC SACR4.MASK 0xFC	RW

3.4.2 Example of Connection

Following figures shows examples of connection to 32-, 16- and 8-bit data width normal memory.

Figure 3-2 Example of 32-Bit Data Width SRAM Connection

Figure 3-3 Example of 16-Bit Data Width SRAM Connection

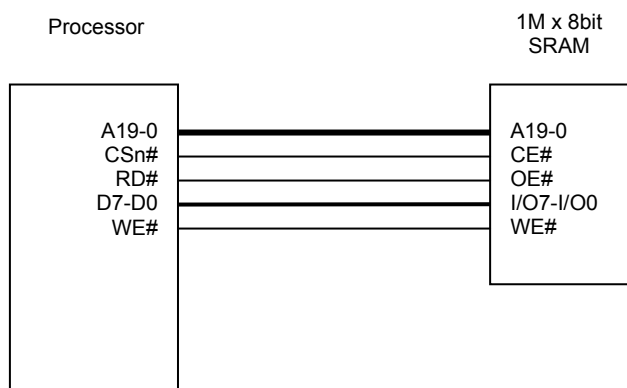

Figure 3-4 Example of 8-Bit Data Width SRAM Connection

3.4.3 Basic Interface

When SMT field in SMCRn ($n = 1$ to 4) is 0 and BCM field is 0, normal memory (non-burst ROM, Flash, normal SRAM or memory-like device) is connected to bank n . When bank n ($n = 1$ to 4) is accessed, CSn# is asserted as soon as address is output. In addition, the RD# signal, which can be used as OE#, and write control signals, WE0# to WE3#, are asserted.

The TAS field in SMCRn is the latency from CSn# to read/write strobe. The TAW3 field is the delay time of RD# in read access. TBP3~0 field is the delay time of WE# and WEn# in write access. In addition, any number of waits can be inserted by means of the external pin (WAIT#). The TAH field is the latency from RD# and WEn# negation to CSn# negation, also the hold time to address and write data.

All kinds of normal memories (non-burst ROM, normal SRAM and Flash) have the same read and write timing. There are some requirements for writes to flash memory. Flash memory space must be un-cacheable and un-buffered. Writes must be exactly the width of the populated Flash devices on the data bus (no byte writes to a 32-bit bus or word writes to a 16-bit bus, and so on). Software is responsible for partitioning commands and data, and writing them out to Flash in the appropriate sequence.

Glossary

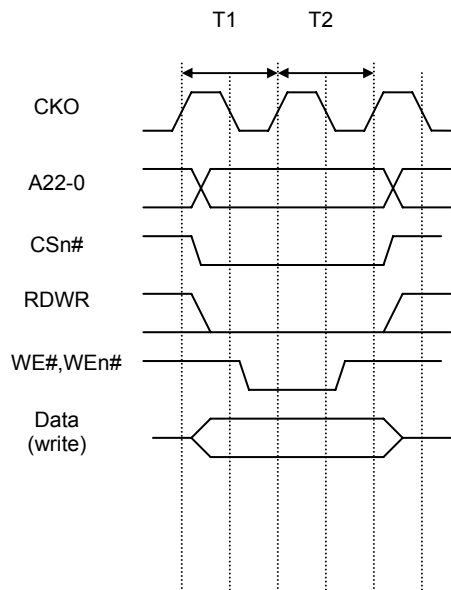

- Th – hold cycle
- Tw – wait cycle
- Ts – setup cycle
- T1 – read inherent cycle or first write inherent cycle
- T2 – last write inherent cycle
- Tb – burst read inherent cycle

Following figures show the timing of normal memory. A no-wait read access is completed in one cycle and a no-wait write access is completed in two cycles. Therefore, there is no negation period in case of access at minimum pitch.

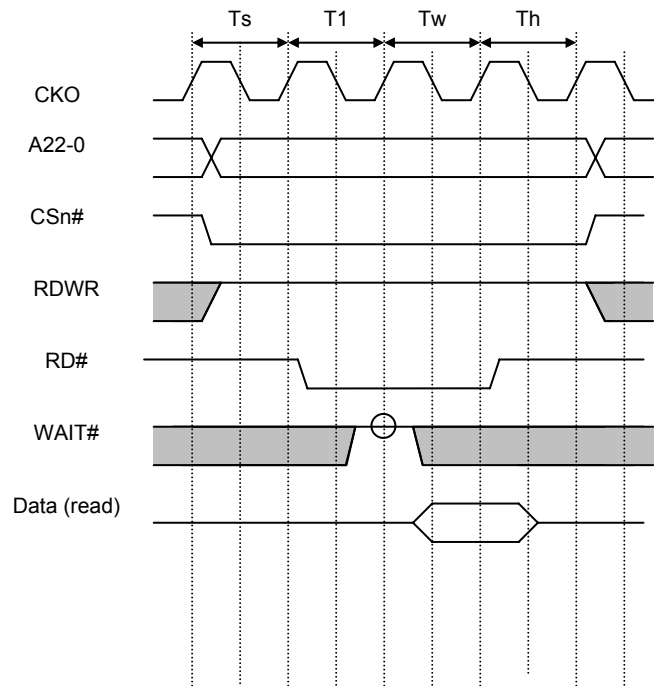

*In this example, SMCRn:MT = 0, BCM = 0, TAS = 0, TAW = 0, TAH = 0

Figure 3-5 Basic Timing of Normal Memory Read

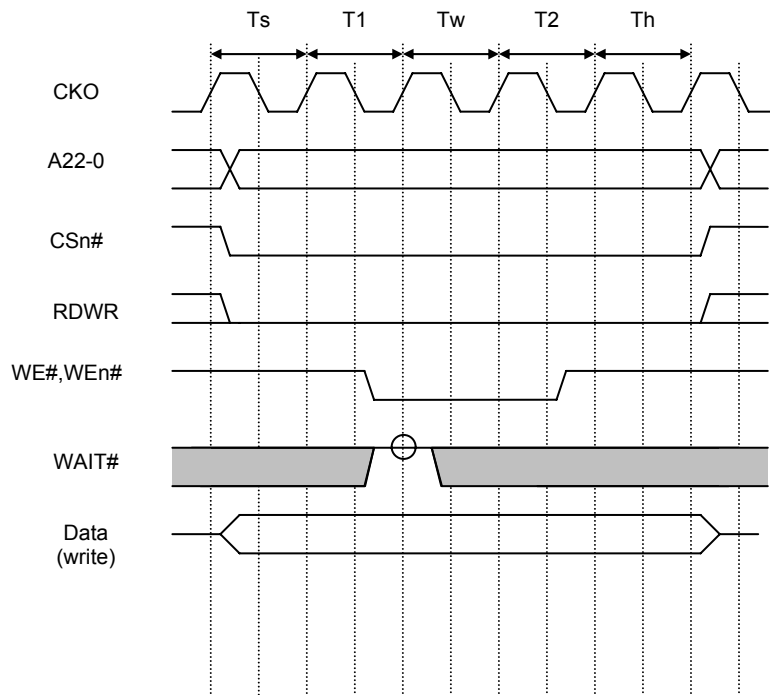

*In this example, SMCRn: SMT = 0, BCM = 0, TAS = 0, TBP = 0, TAH = 0

Figure 3-6 Basic Timing of Normal Memory Write

*In this example, SMCRn: SMT = 0, BCM = 0, TAS = 1, TAW = 1, TAH = 1

Figure 3-7 Normal Memory Read Timing With Wait (Software Wait Only)

*In this example, SMCRn: SMT = 0, BCM = 0, TAS = 1, TBP = 1, TAH = 1

Figure 3-8 Normal Memory Write Timing With Wait (Software Wait Only)

*In this example, SMCRn: SMT = 0, BCM = 0, TAS = 1, TAW = 1, TAH=1

Figure 3-9 Normal Memory Read Timing With Wait (Wait Cycle Insertion by WAIT# pin)

3.4.4 Byte Control

The byte control SRAM interface is a memory interface that outputs a byte select strobe WEn# in both read and write bus cycles. It has 16 bit data pins, and can be directly connected to SRAM which has an upper byte select strobe and lower byte select strobe function such as UB# and LB#.

In read/write access, RD#/WE# is used as read/write strobe signal and WEn# are used as byte select signals.

Following figure shows an example of byte control SRAM connection to processor.

Figure 3-10 Example of 32-Bit Data Width Byte Control SRAM Connection

Following figures show examples of Byte Control SRAM timing.

*In this example, SMCRn: SMT = 0, BCM = 1, TAS = 1, TAW = 1, TAH = 1

Figure 3-11 Byte Control SRAM Read Timing

*In this example, SMCRn: SMT = 0, BCM = 1, TAS = 1, TBP = 1, TAH = 1

Figure 3-12 Byte Control SRAM Write Timing

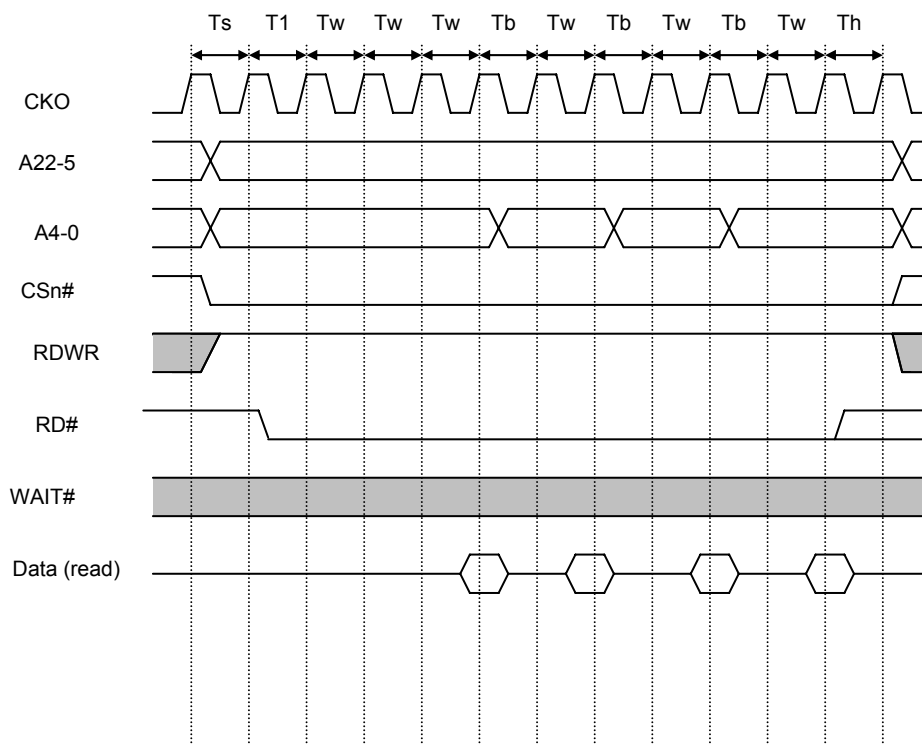

3.4.5 Burst ROM Interface

Setting SMT to 1 in SMCRn allows burst ROM to be connected to bank n ($n = 1$ to 4). The burst ROM interface provides high-speed access to ROM that has a nibble access function. Basically, access is performed in the same way as for normal memory, but when the first cycle ends, only the address is changed before the next access is executed. When 8-bit burst ROM is connected, the number of consecutive accesses can be set as 4, 8, 16, or 32 with bits BL1~0. When 16-bit ROM is connected, 4, 8, or 16 can be set in the same way. When 32-bit ROM is connected, 4 or 8 can be set.

For burst ROM read, TAW sets the delay time from read strobe to the first data, TBP sets the delay time from consecutive address to data. Burst ROM writes have the same timing as normal memory except TAW instead of TBP is used to set the delay time of write strobe.

WAIT# pin sampling is always performed when one or more wait states are set.

Following figures show the timing of burst ROM.

*In this example, SMT = 1, BL = 0, TAS = 1, TAW = 3, TBP = 1, TAH = 1

Figure 3-13 Burst ROM Read Timing (Software Wait Only)

3.5 NAND Flash Interface

NAND flash can be connected to static memory bank 4~ band 1. Both 8-bit and 16-bit NAND flashes are supported. Hardware ECC generator is implemented (including Hamming and RS codes correction). A mechanism for booting from NAND flash is also supported.

3.5.1 Register Description

Table 3-5 NAND Flash Interface Registers

Name	Description	RW	Reset Value	Address	Access Width
NFCSR	NAND flash control/status register	RW	0x00000000	0x13010050	32
NFECCR	NAND flash ECC control register	RW	0x00000000	0x13010100	32
NFECC	NAND flash ECC data register	R	Undefined	0x13010104	32
NFPAR0	NAND flash RS Parity 0 register	RW	0x00000000	0x13010108	32/16/8
NFPAR1	NAND flash RS Parity 1 register	RW	0x00000000	0x1301010C	32/16/8
NFPAR2	NAND flash RS Parity 2 register	RW	0x00000000	0x13010110	32/16/8
NFINTS	NAND flash Interrupt Status register	RW	0x00000000	0x13010114	32
NFINTE	NAND flash Interrupt Enable register	RW	0x00000000	0x13010118	32
NFERR0	NAND flash RS Error Report 0 register	R	0x00000000	0x1301011C	32/16
NFERR1	NAND flash RS Error Report 1 register	R	0x00000000	0x13010120	32/16
NFERR2	NAND flash RS Error Report 2 register	R	0x00000000	0x13010124	32/16
NFERR3	NAND flash RS Error Report 3 register	R	0x00000000	0x13010128	32/16

3.5.1.1 NAND Flash Control/Status Register (NFCSR)

NFCSR is a 32-bit read/write register that configure NAND flash. It is initialized by any reset.

Bits	Name	Description	RW
31:16	Reserved	Writes to these bits have no effect and read always as 0.	R
1/3/5/7	FCEn (n=1,2,3,4)	NAND Flash FCE# Assertion Control : Controls the assertion of NAND Flash FCEn#. When set, FCEn# is always asserted until this bit is cleared. When the NAND flash require FCEn# to be asserted during read	RW

		busy time, this bit should be set. FCE Description 0 FCE# is asserted as normal static chip enable(Initial value) 1 FCE# is always asserted	
0/2/4/6	NFEn (n=1,2,3,4)	NAND Flash Enable: Specifies if NAND flash is connected to static bank n. When system is configured to boot from NAND flash, this bit is initialized to 1. NFE Description 0 Static bank n is not used as NAND flash. 1 Static bank n is used as NAND flash.	RW

3.5.1.2 NAND Flash ECC Control Register (NFECCR)

NFECCR is a 32-bit read/write register that is used to control ECC calculation. It is initialized by any reset.

Bits	Name	Description	RW
31:5	Reserved	Writes to these bits have no effect and read always as 0.	R
4	PRDY	PAR Ready: It is used to indicate the parity data is ready in NFPAR0~2 register during RS decoding. It is automatically cleared by hardware and always read as 0. PRDY Description 0 Parity data is not available (Initial value) 1 Parity data is ready in NFPAR0~2 registers	W
3	ENCE	RS Encoding/Decoding Select: It is used to define whether in encoding or in decoding phase when RS is used. ENCE Description 0 Decoding (Initial value) 1 Encoding	RW
2	RSE	Hamming and RS codes Select: It is used to select the correction algorithm between Hamming and RS codes. RSE Description 0 Hamming (Initial value) 1 Reed-Solomn (RS)	RW

1	ERST	NAND Flash ECC Reset: It is used to reset ECC controller. This bit is cleared automatically by hardware and always read as 0. ERST Description 0 ECC controller is not reset(Initial value) 1 ECC controller is reset	W
0	ECCE	NAND Flash ECC Enable: ECC correction is enable/disable. ECCE Description 0 ECC is disabled (initial value) 1 ECC is enabled	RW

3.5.1.3 NAND Flash ECC Data Register (NFECC)

NFECC is a 32-bit read only register that contains the result of ECC calculation. It is not initialized by any reset. When ERST of NFECCR is set, NFECC is initialized to 0.

Bits	Name	Description	RW
31:24	Reserved	Writes to these bits have no effect and read always as 0.	R
23:16	ECC2	Byte 2 of ECC.	R
15:8	ECC1	Byte 1 of ECC.	R
7:0	ECC0	Byte 0 of ECC.	R

3.5.1.4 NAND Flash Parity Register (NFPARn, n=0,1,2)

NFPAR0, NFPAR1 and NFPAR2 are all 32-bit read/write register that contains the encoding and decoding parity data during RS correction. It is initialized by any reset and ERST of NFECCR.

PARn (n=0~7), total 8 9-bit register together contains the parity data during RS correction. In encoding, they are written by hardware and software needs to read out and write into NAND flash spare space after NFINTS.ENCF bit is set to 1. In decoding, they are written by software. Software should first read out the 512B nand flash data and then 8 9-bit parity data and write the parity data into PARn registers.

3.5.1.5 NAND Flash Interrupt Status Register (NFINTS)

NFINTS is a 32-bit read-only register that contains the interrupt flag and error count information during RS correction. It is initialized by any reset. Software write 0 to clear the corresponding bit except ERRC.

Bits	Name	Description	RW						
31:29	ERRC	<p>ERR Count: It indicates the number of errors in the nand flash data block and these bits are also reset by NFECCR.ERST bit.</p> <table style="width: 100%; border-collapse: collapse;"> <tr> <th style="text-align: left;">ERRC</th> <th style="text-align: left;">Description</th> </tr> <tr> <td style="text-align: center;">0</td> <td>No errors or uncorrection error occurs (Initial value)</td> </tr> <tr> <td style="text-align: center;">1</td> <td>One error in the nand flash data block</td> </tr> </table>	ERRC	Description	0	No errors or uncorrection error occurs (Initial value)	1	One error in the nand flash data block	R
ERRC	Description								
0	No errors or uncorrection error occurs (Initial value)								
1	One error in the nand flash data block								

		2 Two errors in the nand flash data block 3 Three errors 4 Four errors	
28:5	Reserved	Writes to these bits have no effect and read always as 0.	R
4	PADF	Padding Finish: It indicates that hardware finish padding zero after reading the 512B nand flash data block during RS decoding. PADF Description 0 Padding not finish (Initial value) 1 Padding finish	R
3	DECF	Decoding Finish: It indicates that hardware finish RS decoding. PADF Description 0 Decoding not Finish (Initial value) 1 Decoding Finish	R
2	ENCF	Encoding Finish: It indicates that hardware finish RS encoding. PADF Description 0 Encoding not Finish (Initial value) 1 Encoding Finish	R
1	UNCOR	Uncorrection Error: It indicates that hardware finish RS encoding. UNCOR Description 0 No uncorrectable error (Initial value) 1 Uncorrectable error occur	R
0	ERR	Error: It indicates that hardware detects error data in the 512B nand flash data block during RS decoding. ERR Description 0 No error (Initial value) 1 Error occur	R

3.5.1.6 NAND Flash Interrupt Enable Register (NFINTE)

NFINTE is a 32-bit read/write register that is used to enable/disable nand flash interrupt during RS correction. It is initialized by any reset.

Bits	Name	Description	RW
31:5	Reserved	Writes to these bits have no effect and read always as 0.	R
4	PADFE	Padding Finish Interrupt Enable: It is used enable or disable padding	RW

		finish interrupt. PADFE Description 0 Disable Padding finish interrupt (Initial value) 1 Enable Padding finish interrupt	
3	Reserved	Writes to these bits have no effect and read always as 0.	R
2	EDCFE	Encoding/Decoding Finish Interrupt Enable: It is used to enable or disable encoding and decoding finish interrupt. EDCFE Description 0 Disable Encoding/Decoding Finish Interrupt (Initial value) 1 Enable Encoding/Decoding Finish Interrupt	RW
1	UNCORE	Uncorrection Error Interrupt Enable: It is used to enable or disable uncorrection error interrupt. UNCORE Description 0 Disable Uncorrectable Error interrupt (Initial value) 1 Enable Uncorrectable Error Interrupt	RW
0	ERRE	Error Interrupt Enable: It is used to enable or disable error interrupt. ERRE Description 0 Disable Error interrupt (Initial value) 1 Enable Error interrupt	RW

3.5.1.7 NAND Flash Error Report Register (NFERRn, n=0,1,2,3)

NFERRn is 32-bit read/write register that contains the index and error value for each error symbol after RS decoding. It is initialized by any reset and ERST of NFECRC.

- NFERR0 0x1301011C
- NFERR1 0x13010120
- NFERR2 0x13010124
- NFERR3 0x13010128

Bits	Name	Description	RW
31:25	Reserved	Writes to these bits have no effect and read always as 0.	R
24:16	INDEXn	Error Symbol Index: It is used to indicate the location of the error symbol in the 511 symbols. For example, INDEX=1, it means the first symbol has error bits.	R
15:9	Reserved	Writes to these bits have no effect and read always as 0.	R

8:0	MASKn	Error Symbol Value: It is used to indicate the error value of the indexed symbol. For example, INDEX=1, and MASK=3, it means the first two bits of the first symbol are wrong, and software need to XOR MASK and the indexed symbol to get the right data.	R
-----	-------	---	---

3.5.2 NAND Flash Boot Loader

To support boot from NAND flash, 4KB on-chip Boot ROM is implemented. Following figure illustrates the structure of NAND Flash Boot Loader.

Figure 3-14 Structure of NAND Flash Boot Loader

When system is configured to boot from NAND flash, after reset, the program in Boot ROM is executed and the program will copy the first 4K bytes of NAND flash to internal memory for further initialization.

Generally, the boot code will copy more NAND flash content to SDRAM. Hardware ECC can be utilized to check the data validity. Then the main program will be executed on SDRAM.

When system is configured to boot from NAND flash, software may know the nand flash page size through BOOT_SEL[1:0] pin.

3.5.3 NAND Flash Operation

Set NFEn bit of NAND Flash Control/Status Register (NFCSR) will enable access to NAND flash. The partition of static bank n (n=1~4) is changed as following figure. Writes to any of address space will be translated to NAND flash address cycle. Writes to any of command space will be translated to NAND flash command cycle. Caution: don't read to address and command space, and these two partitions should be uncacheable. Reads and writes to any of data space will be translated to NAND flash data read/write cycle. DMA access to data space is supported to increase the speed of data read/write. The DMA access cannot exceed the page boundary (512 bytes or 2K bytes) of NAND flash.

Figure 3-15 Static Bank 2 Partition When NAND Flash is Used (an example)

The timing of NAND flash access is configured by SMCRn and is same as normal static memory timing, except that CSn# is controlled by NFCE bit NFCSR. CSn# is always asserted when NFCE is 1. When NFCE is 0, CSn# is asserted as normal static memory access.

The control signals for direction connection of NAND flash are CSn#, FRE#, FWE#, FRB#(GPIO), A16 and A15. Following figure shows the connection between processor and NAND Flash.

Figure 3-16 Example of 8-bit NAND Flash Connection

Hardware ECC generation for 8-/16-bit organization is implemented. There are two algorithm that could be used.

3.5.3.1 Hamming

When using Hamming algorithm, ECC parity code consists of 24 bits per 512 bytes (256 halfwords) and 22 bits per 256 bytes. Following table shows the ECC code assignment.

Table 3-6 512-Byte ECC Parity Code Assignment Table For 8-bit NAND Flash

	Data7	Data6	Data5	Data4	Data3	Data2	Data1	Data0
ECC0	P64	P64'	P32	P32'	P16	P16'	P8	P8'
ECC1	P1024	P1024'	P512	P512'	P256	P256'	P128	P128'
ECC2	P4	P4'	P2	P2'	P1	P1'	P2048	P2048'

24-bit ECC parity code = 18-bit line parity + 6-bit column parity.

Table 3-7 256-Byte ECC Parity Code Assignment Table For 8-bit NAND Flash

	Data7	Data6	Data5	Data4	Data3	Data2	Data1	Data0
ECC0	P64	P64'	P32	P32'	P16	P16'	P8	P8'
ECC1	P1024	P1024'	P512	P512'	P256	P256'	P128	P128'
ECC2	P4	P4'	P2	P2'	P1	P1'	X	X

22-bit ECC parity code = 16-bit line parity + 6-bit column parity.

Table 3-8 256-Halfword ECC Parity Code Assignment Table For 16-bit NAND Flash

	Data7	Data6	Data5	Data4	Data3	Data2	Data1	Data0
ECC0	P128	P128'	P64	P64'	P32	P32'	P16	P16'
ECC1	P2048	P2048'	P1024	P1024'	P512	P512'	P256	P256'
ECC2	P8	P8'	P4	P4'	P2	P2'	P1	P1'

24-bit ECC parity code = 16-bit line parity + 8-bit column parity.

3.5.3.2 Reed-Solomn

RS controller uses RS(511, 503) codes. The total codes have 511 symbols, each symbol is 9-bit. The message has 503 9-bit symbols. So 512B nand flash data will be split into 9-bit symbols and it is 455 1/9 symbols, and then hardware will padding 47 8/9 zero symbol to build the 503 symbol message. During encoding, after padding zero, hardware will generate 8 9-bit parity symbol, software should read out the parity and write into nand flash spare space. During decoding, after reading out the 512B data and padding zero, hardware will using the parity data in NFPAR0~2 written by software to generate error information in NFERR0~3. Software should first read out the 512B nand flash data and then the parity data and write the parity data into NFPAR0~2.

NAND Flash Initialize Sequence:

- 1 Configure SMCRn (n=1,2,3,4) according to the NAND flash AC characteristics.
- 2 Set NFEn bit of NFCSR to 1.

NAND Flash Program Sequence:

- 1 Set NFCEn bit of NFCSR to 1 to assert CSn# continuously.
- 2 Write 0x80 to command space to issue Page Program command.
- 3 Write 2 or 3 bytes of address to address space.
- 4 Enable and reset the ECC generator by setting ECCE and ERST bits of NFECCR.
- 5 Select Hamming or RS algorithm by setting NFECCR.RSE, 0: Hamming, 1: RS.
- 6 If using RS algorithm, set NFECCR.ENCE to 1.
- 7 Write 256 or 512 bytes data to data space using Hamming, write 512B data using RS.
- 8 When using Hamming, clear ECCE bit of NFECCR to disable ECC generator and read out the ECC parity code from NFECC register, write 16-byte redundant data.
- 9 When using RS, poll NFINTS.ENCF bit or wait for ENCF interrupt, and read out parity data from NFPAR0~2 register and write them into nand flash spare space.
- 10 Write 0x10 to command space to issue Page Program command.
- 11 Clear NFCEn bit of NFCSR to deassert CSn#.
- 12 Check RB bit of NFCSR to wait the program complete.

NAND Flash Read Sequence:

- 1 Set NFCEn bit of NFCSR to 1 to assert CSn# continuously.
- 2 Write 0x00 to command space to issue Read command.
- 3 Write 2 or 3 bytes of address-to-address space.

- 4 Enable and reset the ECC generator by setting ECCE and ERST bits of NFECCR.
- 5 Select Hamming or RS algorithm by setting NFECCR.RSE, 0: Hamming, 1: RS.
- 6 Check RB# pin (GPIO) to wait for NAND flash is not busy.
- 7 When using Hamming, Read 256 or 512 bytes from NAND flash (DMA can be used), clear ECCE bit of NFECCR to disable ECC generator and Read 16-byte redundant data from NAND flash, then read out the ECC parity code from NFECC register, compare these two parity codes and correct the error bit or run the error routine.
- 8 When using RS, Read 512 bytes data and 9 bytes parity data from NAND flash (DMA can be used), poll NFINTS.DECF bit or wait for decoding finish interrupt, and then analyze error status in NFINTS register, if there is any error, read NFERR0~3 registers, find the error byte according to NFERRn.INDEXn and XOR NFERRn.MASKn with the indexed bytes to get the correct data.
- 9 If continuous pages are needed to be read, repeat steps from 5 to 9.
- 10 Clear NFCEn bit of NFCSR to deassert CSn#.

ECC Generation Sequence for large page:

In large page (2KBX8/1KHWX16 org.), 24-bit ECC code is generated for every 512 bytes or 256 halfwords data. Software gets ECC codes as following steps:

- 1 Set ERST bit of NFECCR to reset ECC generator.
- 2 Read/write 512 bytes / 256 halfwords data.
- 3 Read out 24-bit ECC code from NFECC register.
- 4 Repeat step 1 to 3 until whole page is completed.
- 5 Write spare area according to above ECC codes.

3.6 SDRAM Interface

The SDRAM controller provides a glueless interface to industry standard SDRAM chip. The SDRAM controller provides one chip selects DCS# supporting 16-bit or 32-bit wide SDRAM.

Both 2-bank and 4-bank SDRAM modules are supported. The bank select signals are always output from the A13 pin and A14 pin of processor.

The SDRAM interface includes the following signals:

- One chip selects, DCS#
- Four byte mask signals, DQM3~0#
- 15 multiplexed bank/row/column address signals, A14-A0
- One write enable, RD/WR#
- One column-address strobe CAS#
- One row-address strobe RAS#
- One clock enable CKE
- One clock CKO

The processor performs auto-refresh ([CBR](#)) during normal operation and supports self-refreshing SDRAM during sleep, hibernate, and frequency-change modes. An SDRAM power-down mode bit (DMCR[PDM]) can be set so that the CKO and the clock-enable signal CKE to SDRAM are automatically deasserted whenever none of the corresponding banks is being accessed.

3.6.1 Register Description

Table 3-9 SDRAM Registers

Name	Description	RW	Reset Value	Address	Access Width
DMCR	DRAM control register	RW	0x0000 0000	0x13010080	32

RTCNT	Refresh timer counter	RW	0x0000	0x13010088	16
RTCOR	Refresh time constant register	RW	0x0000	0x1301008C	16
DMAR	SDRAM bank address configuration register	RW	0x000020F8	0x13010090	32
SDMR	Mode register of SDRAM bank	W	--	0x1301A000	8

3.6.1.1 SDRAM Control Register (DMCR)

DMCR is a 32-bit read/write register that specifies the timing, address multiplexing and refresh control of SDRAM. This enables direct connection of SDRAM without external circuits.

The DMCR is initialized to 0x00000000 by any resets. SDRAM bank should not be accessed until initialization is completed.

Bits	Name	Description	RW										
31	BW	Specifies the data bus width of SDRAM. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>BW</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Data width is 32 bits (Initial value)</td> </tr> <tr> <td>1</td> <td>Data width is 16 bits</td> </tr> </tbody> </table>	BW	Description	0	Data width is 32 bits (Initial value)	1	Data width is 16 bits	RW

3.6.1.2 SDRAM Mode Register (SDMR)

SDMR is written to via the SDRAM address bus and is a 10-bit write-only register. It sets SDRAM mode for SDRAM bank. SDMR is undefined after a reset.

Write to the SDRAM mode register use the address bus rather than the data bus. If the value to be set is X and the SDMR address is Y, the value X is written in the SDRAM mode register by writing in address X + Y. Here Y is 0xA000, X is value for SDRAM configuration. For example Y is 0x022, random data is written to the address offset 0xA022, as a result, 0x022 is written to the SDMR register. The range for value X is 0x000 to 0x3FF.

The Mode Register is used to define the specific mode of operation of the SDRAM. This definition includes the section of a burst length, a burst type, a CAS latency, an operating mode and a write burst mode, as shown in following figure.

Figure 3-17 Synchronous DRAM Mode Register Configuration

3.6.1.3 Refresh Timer Control/Status Register (RTCSR)

RTCSR is a 16-bit readable/writable register that specifies the refresh cycle and the status of RTCNT.

RTCSR is initialized to 0x0000 by a reset.

Bits	Name	Description	RW																		
15:8	Reserved	These bits always read 0. Data written to these bits are ignored.	R																		
7	CMF	<p>Compare-Match Flag (CMF): Status flag that indicates a match between the refresh timer counter (RTCNT) and refresh time constant register (RTCOR) values. Writes to 1 of this bit have no effect.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 15%;">CMF</th> <th style="width: 85%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>RTCNT and RTCOR values do not match (Initial value) Clear condition: When 0 is written</td> </tr> <tr> <td style="text-align: center;">1</td> <td>RTCNT and RTCOR values match Set condition: When RTCNT = RTCOR</td> </tr> </tbody> </table>	CMF	Description	0	RTCNT and RTCOR values do not match (Initial value) Clear condition: When 0 is written	1	RTCNT and RTCOR values match Set condition: When RTCNT = RTCOR													
CMF	Description																				
0	RTCNT and RTCOR values do not match (Initial value) Clear condition: When 0 is written

3.6.1.4 Refresh Timer Counter (RTCNT)

RTCNT is a 16-bit read/write register. RTCNT is a 16-bit counter that counts up with input clocks. The clock select bits (CKS2–CKS0) of RTCSR select the input clock. When the refresh bit (RFSH) of the memory control register (DMCR) is set to 1 and the refresh mode is set to auto-refresh, a memory refresh cycle starts when RTCNT matches RTCOR. RTCNT is initialized to 0x0000 by a reset.

3.6.2 Refresh Time Constant Register (RTCOR)

RTCOR is a 16-bit read/write register. The values of RTCOR and RTCNT (bottom 8 bits) are constantly compared. When the refresh bit (RFSH) of the memory control register (DMCR) is set to 1 and the refresh mode bit (RMODE) is set to auto-refresh, a memory refresh cycle starts when RTCNT matches RTCOR. RTCOR is initialized to 0x0000 by a reset.

3.6.2.1 DRAM Bank Address Configuration Register (DMAR)

DMAR define the physical address for SDRAM bank, respectively. Each register contains a base address and a mask. When the following equation is met:

$$(physical_address [31:24] \& MASK_n) == BASE_n$$

The bank n is active. The *physical_address* is address output on internal system bus. DRAM bank regions must be programmed so that each bank occupies a unique area of the physical address space. Programming overlapping bank regions will result in unpredictable error.

These registers are initialized by a reset.

Bits	Name	Description	RW
31:16	Reserved	Writes to these bits have no effect and read always as 0.	R
15:8	BASE	Address Base: Defines the base address of SDRAM Bank. The initial values are: DMAR.BASE 0x20	RW
23:20	MASK	Address Mask: Defines the mask of SDRAM Bank. The initial values are: DMAR.MASK 0xF8	RW

3.6.3 Example of Connection

Following figure shows an example of connection of 512K x 16-bit x 2-bank SDRAM.

Figure 3-18 Example of Synchronous DRAM Chip Connection (1)

Following figure shows an example of connection of 1M x 16-bit x 4-bank synchronous DRAM.

Figure 3-19 Example of Synchronous DRAM Chip Connection (2)

3.6.4 Address Multiplexing

SDRAM can be connected without external multiplexing circuitry in accordance the address multiplex specification bits CA2~0, RA1~0 and BA in DMCR. Table 3-10 shows the relationship between the address multiplex specification bits and the bits output at the address pins.

A14-0 is used as SDRAM address. The original values are always output at these pins.

Table 3-10 SDRAM Address Multiplexing (32-bit data width) *4

signals are used (BA = 1), take A13 and A14 as bank select signals.

- 4 *4: The A0 to A14 in table head are output pins. The A2 to A28 in table body are physical address.

3.6.5 SDRAM Command

Commands for SDRAM are specified by RAS#, CAS#, RD/WR and special address signals. The processor accesses SDRAM by using the following subset of standard interface commands.

- Mode Register Set (MRS)
- Bank Activate (ACTV)
- Read (READ)
- Write (WRIT)
- Burst Terminate
- Precharge All Banks (PALL)
- Auto-Refresh (CBR)
- Enter Self-Refresh (SLFRSH)
- No Operation (NOP)

Table 3-12 SDRAM Command Encoding (NOTES: 1)

Command	Processor Pins							
	CS#	RAS#	CAS#	RD/WR#	DQM	A14-11, A9-0	A10	NOTE
INHIBIT	H	X	X	X	X	X	X	
NOP	L	H	H	H	X	X	X	
MRS	L	L	L	L	X	Op-Code		
ACTV	L	L	H	H	X	Bank, Row	X	2
READ	L	H	L	H	L/H	Bank, Col	L	3
WRIT	L	H	L	L	L/H	Bank, Col	L	3
Burst Terminate	L	H	H	L	X	X	X	
PRE	L	L	H	L	X	Bank	L	
PALL	L	L	H	L	X	X	H	
CBR/SLFRSH	L	L	L	H	X	X	X	4

NOTES:

- 1 CKE is HIGH for all commands shown except SLFRSH.
- 2 A0-A12 provides row address, and A13-A14 determines which bank is active.
- 3 A0-A9 provides column address, and A13-A14 determines which bank is being read from or written to.
- 4 This command is CBR if CKE is HIGH, SLFRSH if CKE is LOW.

3.6.6 SDRAM Timing

The SDRAM bank function is used to support high-speed accesses to the same row address. As SDRAM is internally divided into two or four banks, it is possible to activate one row address in each bank.

When a de-active bank is accessed, an access is performed by issuing an ACTV command following by READ or WRIT command.

When an active bank is accessed and just hit the open row, an access is performed by issuing READ or WRIT command immediately without issuing an ACTV command.

When an active bank is accessed but hit a closed row, a PRE command is first issued to precharge the bank, then the access is performed by issuing an ACTV command followed by a READ or WRIT command.

There is a limit on T_{ras} , the time for placing each bank in the active state. If there is no guarantee that there will not be a cache hit and another row address will be accessed within the period in which this value is maintained by program execution, it is necessary to set auto-refresh and set the refresh cycle to no more than the maximum value of T_{ras} . In this way, it is possible to observe the restrictions on the maximum active state time for each bank. If auto-refresh is not used, measures must be taken in the program to ensure that the banks do not remain active for longer than the prescribed time.

Glossary

T_r – row active cycle
 T_{rw} – row active wait cycle
 T_{rw1} – write latency cycle
 T_{pc} – precharge cycle
 T_{Rr} – refresh command cycle
 T_{rc} – RAS cycle
 T_{rs1} – self refresh cycle 1
 T_{rs2} – self refresh cycle 2
 T_{rs3} – self refresh cycle 3
 T_{rsw} – self refresh wait cycle
 T_{c1} – command cycle 1
 T_{c2} – command cycle 2
 T_{c3} – command cycle 3
 T_{c4} – command cycle 4
 T_{c5} – command cycle 5
 T_{c6} – command cycle 6
 T_{c7} – command cycle 7
 T_{c8} – command cycle 8

Figure 3-31 Synchronous DRAM Single Write Timing (Same Row)

3.6.7 Power-Down Mode

The SDRAM power-down mode is supported to minimize the power consumption. CKE going to low level when SDRAM is idle/active state will drive SDRAM to precharge/active power-down mode. The clock supplies to SDRAM may be stopped also when CKE keep in low level more than two cycles. When a new access start or a refresh request, CKE is driven to high level and clock supplies is re-enabled. In power-down mode, clock of the accessed SDRAM bank pair is supplied. Clock of the other pair is stopped.

Following figures shows the timing of power-down mode and clock stopping.

Figure 3-32 SDRAM Power-Down Mode Timing (CKO Stopped)

Following figure shows the power-down mode timing that CKE low level less than two cycles and clock is not stopped.

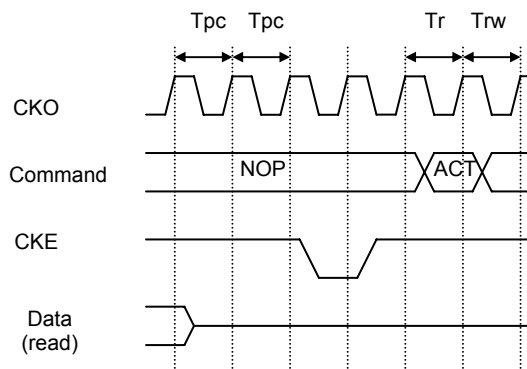

Figure 3-33 SDRAM Power-Down Mode Timing (Clock Supplied)

3.6.8 Refreshing

EMC provide a function for controlling the refresh of synchronous DRAM, Auto-refresh can be performed by clearing the RMODE bit to 0 and setting the RFSH bit to 1 in DMCR. If SDRAM is not accessed for a long period, self-refresh mode can be activated by set both the RMODE bit and the RFSH bit to 1.

3.6.8.1 AUTO-Refresh

Refreshing is performed at intervals determined by the input clock selected by bits CKS2-0 in RTCSR, and the value set in RTCOR. The value of bits CKS2-0 in RTCSR should be set so as to satisfy the refresh interval stipulation for the synchronous DRAM used. First make the settings for RTCOR, RTCNT, and the RMODE and RFSH bits in MCR, and then make the CKS2-CKS0 setting. When the clock is selected by CKS2-CKS0, RTCNT starts counting up from the value at that time. The RTCNT value is constantly compared with the RTCOR value, and if the two values are the same, a refresh request is generated and an auto-refresh is performed. At the same time, RTCNT is cleared to zero and the count-up is restarted. Figure 3-34 shows the auto-refresh cycle operation.

First, a REF command is issued in the TRr cycle. After the TRr cycle, new command output cannot be performed for the duration of the number of cycles specified by the TRC bits in DMCR. The TRC bits must be set so as to satisfy the synchronous DRAM refresh cycle time stipulation (active/active command delay time). Following figure shows the auto-refresh timing when TRC is set to 2.

Auto-refresh is performed in normal operation and sleep mode.

Figure 3-34 Synchronous DRAM Auto-Refresh Operation

A PALL command is issued firstly to precharge all banks. Then a REF command is issued in the TRr

cycle.

Figure 3-35 Synchronous DRAM Auto-Refresh Timing

3.6.8.2 SELF-Refresh

Self-refresh mode is a kind of sleep mode in which the refresh timing and refresh addresses are generated within the SDRAM. Self-refreshing is activated by setting both the RMODE bit and the RFSH bit to 1. The self-refresh state is maintained while the CKE signal is low. SDRAM cannot be accessed while in the self-refresh state. Self-refresh mode is cleared by clearing the RMODE bit to 0. After self-refresh mode has been cleared, command issuance is disabled for the number of cycles specified by the TRC bits in DMCR. Trsw cycles are inserted to meet the minimum CKE negation time specified by the TRAS bits in DMCR. Self-refresh timing is shown in following figure. Settings must be made so that self-refresh clearing and data retention are performed correctly, and auto-refresh is performed at the correct intervals. When self-refreshing is activated from the state in which auto-refreshing is set, or when exiting sleep mode other than through a reset, auto-refreshing is restarted if RFSH is set to 1 and RMODE is cleared to 0 when self-refresh mode is cleared. If the transition from clearing of self-refresh mode to the start of auto-refresh takes time, this time should be taken into consideration when setting the initial value of RTCNT. Making the RTCNT value 1 less than the RTCOR value will enable refreshing to be started immediately. After self-refreshing has been set, the self-refresh state continues even if the chip standby state is entered using the processor's sleep function, and is maintained even after recovery from sleep mode other than through a reset. In the case of a reset, the bus state controller's registers are initialized, and therefore the self-refresh state is cleared.

Self-refreshing is performed in normal operation, in idle mode and in sleep mode. In sleep mode, if RFSH bit in DMCR is 1, self-refresh is always performed in spite of RMODE field in DMCR until sleep mode is canceled.

Relationship between Refresh Requests and Bus Cycle Requests:

If a refresh request is generated during execution of a bus cycle, execution of the refresh is deferred until the bus cycle is completed. If a match between RTCNT and RTCOR occurs while a refresh is waiting to be executed, so that a new Refresh request is generated, the previous refresh request is eliminated. In order for refreshing to be performed normally, care must be taken to ensure that no bus cycle is longer than the refresh interval.

A PALL command is issued firstly to precharge all banks.

* DMCR: TRAS = 0, TRC = 2

Figure 3-36 Synchronous DRAM Self-Refresh Timing

3.6.9 Initialize Sequence

In order to use SDRAM, mode setting must first be performed after powering on. To perform SDRAM initialization correctly, the EMC registers must first be set, followed by a write to the SDRAM mode register.

In SDRAM mode register setting, the address signal value at that time is latched by MRS command. If the value to be set is X, the bus state controller provides for value X to be written to the synchronous DRAM mode register by performing a write to address offset $0xA000 + X$ for bank 0. In this operation the data is ignored, but the mode write is performed as a byte-size access. To set burst read/write, CAS latency 2 to 3, wrap type = sequential, and burst length 4 supported by the processor, arbitrary data is written in a byte-size access to the following addresses.

Table 3-13 SDRAM Mode Register Setting Address Example (32-bit)

	Bank 0			
CAS latency 2	A022	B088	C088	D088
CAS latency 3	A032	B0C8	C0C8	D0C8

Table 3-14 SDRAM Mode Register Setting Address Example (16-bit)

	Bank 0			
CAS latency 2	A011	B044	C044	D044
CAS latency 3	A019	B064	C064	D064

The value set in DMCR.MRSET is used to select whether a Pre-charge All Banks command (PALL) or a Mode Register Set command (MRS) is issued. The timing for the Pre-charge All Banks command is shown in Figure 3-37, and the timing for the Mode Register Set command in Figure 3-38.

Before mode register setting, a 200 μ s idle time (depending on the memory manufacturer) must be guaranteed after powering on requested by the synchronous DRAM. If the reset signal pulse width is greater than this idle time, there is no problem in performing initialize sequence immediately.

First, a pre-CHARGE all bank (PALL) command must be issued by performing a write to address offset $0xA000 + X$ for bank 0, while DMCR.MRSET = 0.

Next the NUMBER of dummy auto-refresh cycles specified by the manufacturer (usually 8) or more must be executed. This is usually achieved automatically while various kinds of initialization are being performed after auto-refresh setting, but a way of carrying this out more dependably is to set a short refresh request generation interval just while these dummy cycles are being executed. With simple read or write access, the address counter in the synchronous DRAM used for auto-refreshing is not initialized, and so the cycle must always be an auto-refresh cycle.

After auto-REFRESH has been executed at least the prescribed number of times, a Mode Register Set command (MRS) is issued in the TMw1 cycle by setting DMCR.MRSET to 1 and performing a write to address offset 0xA000 + X.

An example of SDRAM operation flow is as the following:

- 1 Disable Bus release.
Write 0x00000000 to BCR.
- 2 Initialize RTCOR and RTCNT for auto-refresh cycle.
Before configure SDRAM SDMR, SDRAM needs to execute auto-refresh, the number of times depends on the type of SDRAM. It's better to set a short refresh request generation interval here. For example, set RTCOR to 0x0000000F, and set RTCNT 0x00000000.
- 3 Initialize DMCR for Precharge all bank and auto-refresh.
When DMCR.RMODE=0 and DMCR.RFSH=1, enter auto-refresh mode;
When DMCR.MRSET=0, write SDMR will generate Precharge all bank cycle.
DMCR.TPC must be defined for precharge.
- 4 Disable refresh counter clock.
Write 0x00000000 to RTCSR.
- 5 Execute Precharge all bank before auto-refresh.
Because DMCR.MRSET=0, writing SDMR generates a Precharge all bank cycle, for example, write address (0x1301A000).
- 6 Enable fast refresh counter clock for auto-refresh cycle.
For example, write 0x00000001 to RTCSR.
- 7 Wait for number of auto-refresh cycles. (defined by SDRAM chip)
When RTCSR.CMF=1, it indicates value of RTCOR and RTCNT match and an auto-refresh cycle occurs.
- 8 Configure DMCR for SDRAM MODE Register Set.
When DMCR.MRSET=1, write SDMR generate MRSET cycle.
For example, write 0x059A5231 to DMCR, so that:
Bus-width: 32-bit; Column Address: 9-bit; Row Address: 12-bit; Auto-refresh mode; SDMR Set mode; 4-bank; etc..
- 9 SDRAM Mode Register Set.
Because DMCR.MRSET=1, for example, write address 0x1301A022 to configure SDMR as:
Burst Length: 4 burst
Burst Type: Sequential
CAS Latency: 2
- 10 Set normal auto-refresh counter clock.
For example, write 0x00000005 to RTCSR.
- 11 Then Read/Write SDRAM can be executed.

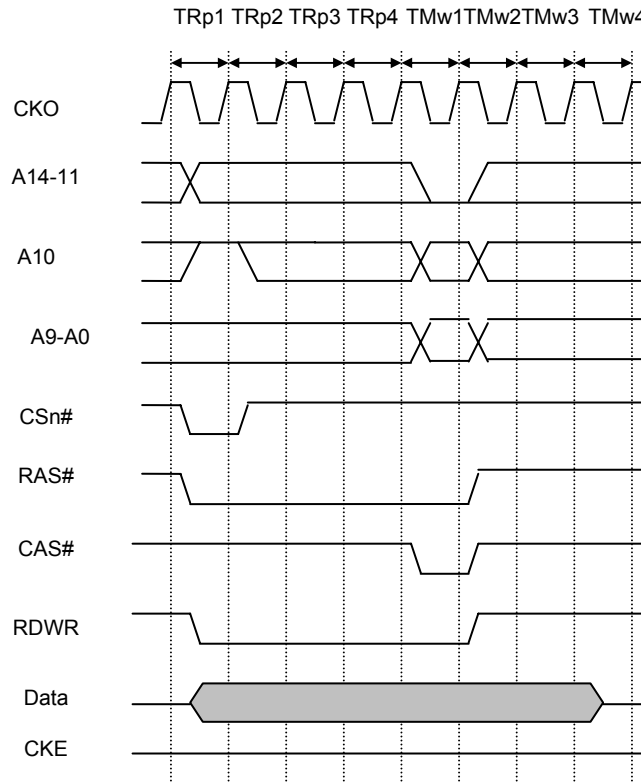

Figure 3-37 SDRAM Mode Register Write Timing 1 (Pre-charge All Banks)

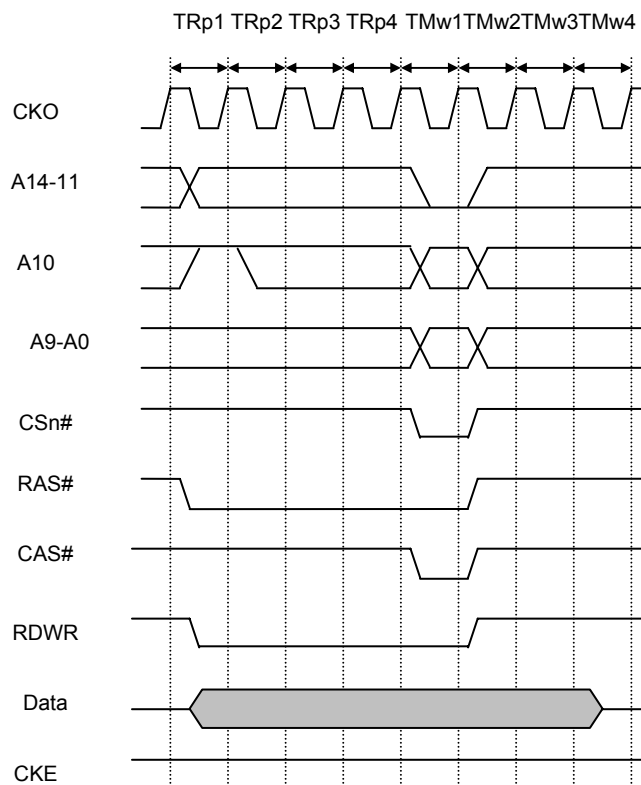

Figure 3-38 SDRAM Mode Register Write Timing 2 (Mode Register Set)

3.7 Bus Control Register (BCR)

BCR is used to specify the behavior of EMC on system bus and indicate the BOOT_SEL[1:0] status which defines the boot configure. It is initialized to 0x00000001 by any reset.

BOOT_SEL[1:0] pins define the boot time configurations as listed in the following table.

Table 3-15 Boot Configuration

Boot_sel[1]	Boot_sel[0]	Description
0	0	Boot from external NOR flash at CS4_
0	1	Boot from USB device
1	0	Boot from 512 Byte page NAND flash at CS1_
1	1	Boot from 2k Byte page NAND flash at CS1_

Name	Description	RW	Reset Value	Address	Access Width
BCR	Bus Control Register	RW	0x?0000001	0x13010000	32

BCR

0x13010000

Bits	Name	Description	RW						
31:30	BT_SEL	BOOT_SEL (BT_SEL[1:0]): Status of BOOT_SEL pins that indicate the boot configure. See the above boot configuration table.	R						
29:2	Reserved	Writes to these bits has no effect and always read as 0.	R						
1	BRE	Bus Release Enable: When clear, once a transaction to EMC begins on the system bus; it must be completed before another transaction starts. When set, the system bus may be released to allow other transaction before EMC prepare the read data or be able to receipt the write data. If slow memory devices are used in the system, setting this bit will improve the efficiency of the whole system. The efficiency of SDRAM access may be improved by setting this bit. But the power consumption is increased if this bit is set. <table border="0"> <tr> <td style="padding-right: 20px;">BRE</td> <td>Description</td> </tr> <tr> <td>0</td> <td>The system bus can not be released during an access (Initial value)</td> </tr> <tr> <td>1</td> <td>The system bus can be released during an access</td> </tr> </table>	BRE	Description	0	The system bus can not be released during an access (Initial value)	1	The system bus can be released during an access	RW
BRE	Description								
0	The system bus can not be released during an access (Initial value)								
1	The system bus can be released during an access								
0	Endian	Endian: Indicates the system is little-endian.	R						

4 DMA Controller

DMA controller (DMAC) is dedicated to transfer data between on-chip peripherals (MSC, AIC, UART, etc.), external memories, and memory-mapped external devices.

4.1 Features

- Support up to 6 independent DMA channels
- Descriptor or No-Descriptor Transfer
- Transfer data units: byte, 2-byte (half word), 4-byte (word), 16-byte or 32-byte
- Transfer number of data unit: $1 \sim 2^{24}$
- Independent source and target port width: 8-bit, 16-bit, 32-bit
- Two channel priority modes: fixed, round robin

4.2 Register Descriptions

Table 4-1 DMAC Registers

Name	Description	RW	Reset Value	Address	Access Size (bit)
DSA0	DMA Source Address 0	RW	0x0	0x13020000	32
DTA0	DMA Target Address 0	RW	0x0	0x13020004	32
DTC0	DMA Transfer Count 0	RW	0x0	0x13020008	32

4.2.1 DMA Source Address (DSAn, n = 0 ~ 5)

Bits	Name	Description	RW
31:0	SA	Source address.	RW

4.2.2 DMA Target Address (DTAn, n = 0 ~ 5)

Bits	Name	Description	RW
31:0	TA	Target address.	RW

4.2.3 DMA Transfer Count (DTCn, n = 0 ~ 5)

Bits	Name	Description	RW
31:24	Reserved	Write has no effect, read as zero.	R
23:0	TC	Hold the number of data unit to transfer and it counts down to 0 at the end.	RW

4.2.4 DMA Request Types (DRTn, n = 0 ~ 5)

Bits	Name	Description	RW
31:5	Reserved	Write has no effect, read as zero.	R
4:0	RT	Transfer request type.	RW

Table 4-2 Transfer Request Types

RT4-0	Description
0~7	Reserved.
8	Auto-request. (ignore RDIL3-0, external address → external address)
9~19	Reserved.
20	UART transmit-fifo-empty transfer request. (external address → UTHR)
21	UART receive-fifo-full transfer request. (URBR → external address)
22	SSI transmit-fifo-empty transfer request.
23	SSI receive-fifo-full transfer request.
24	AIC transmit-fifo-empty transfer request.
25	AIC receive-fifo-full transfer request.

26	MSC transmit-fifo-empty transfer request.
27	MSC receive-fifo-full transfer request.
28	TCU channel n. (overflow interrupt, external address→external address space)
29	SADC transfer request. (SADC → external address)
30	SLCD transfer request. (external address → SLCD)
31	Reserved.

NOTES:

- 1 Only auto request can be concurrently selected in all channels with different source and target address.
- 2 For on-chip device DMA request except TCU, the corresponding source or target address that map to on-chip device must be set as fixed.

4.2.5 DMA Channel Control/Status (DCSn, n = 0 ~ 5)

DCS0, DCS1, DCS2, 0x13020010, 0x13020030, 0x13020050,
DCS3, DCS4, DCS5 0x13020070, 0x13020090, 0x130200b0

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Name	Description	RW
31	NDES	Descriptor or No-Descriptor Transfer Select. 0: Descriptor Transfer; 1: No-descriptor Transfer.	RW
30:24	Reserved	Write has no effect, read as zero.	R
23:16	CDOA	Copy of offset address of last completed descriptor from that in DMA command register. Software could know which descriptor is just completed combining with count terminate interrupt resulted by DCSn.CT. (Ignored in No-Descriptor Transfer)	RW
15:7	Reserved	Write has no effect, read as zero.	R
6	INV	Descriptor Invalid error. 0: no invalid error; 1: descriptor invalid, DCMn.V bit is loaded as 0. (Ignored in No-Descriptor Transfer)	RW
5	Reserved	Write has no effect, read as zero.	R
4	AR	Address Error. 0: no address error; 1: address error.	RW
3	TT	Transfer Terminate. 0: No-Link Descriptor or No-Descriptor DMA transfer does not end 1: No-Link Descriptor or No-Descriptor DMA transfer end	RW

2	HLT	DMA halt. 0: DMA transfer is in progress; 1: DMA halt.	RW
1	CT	Count Terminate. 0: Link DMA transfer does not end; 1: Link DMA transfer end. (Ignored in No-Descriptor Transfer)	RW
0	CTE	Channel transfer enable. 0: disable; 1: enable.	RW

4.2.6 DMA Channel Command (DCMn, n = 0 ~ 5)

DCM0, DCM1, DCM2,
DCM3, DCM4, DCM5

0x13020014, 0x13020034, 0x13020054,
0x13020074, 0x13020094, 0x130200b4

Bits	Name	Description	RW
31:24	Reserved	Write has no effect, read as zero.	R
23	SAI	Source Address Increment. 0: no increment; 1: increment.	RW
22	DAI	Target Address Increment. 0: no increment; 1: increment.	RW
19:16	RDIL	Request Detection Interval Length. Set the number of transfer unit between two requests detection in single mode. Please refer to following Table 4-3.	RW
15:14	SP	Source port width. 00: 32-bit; 01: 8-bit; 10: 16-bit; 11: reserved.	RW
13:12	DP	Target port width. 00: 32-bit; 01: 8-bit; 10: 16-bit; 11: reserved.	RW
11	Reserved	Write has no effect, read as zero.	R
10:8	TSZ	Transfer Data Size of a data unit. 000: 32-bit; 001: 8-bit; 010: 16-bit; 011: 16-byte; 100: 32-byte; others: reserved.	RW
7	TM	Transfer Mode. 0: single mode; 1: block mode.	RW
6:5	Reserved	Write has no effect, read as zero.	R
4	V	Descriptor Valid flag. 0: Descriptor Invalid; 1: Descriptor Valid for transfer. (Ignored in No-Descriptor Transfer and in Descriptor Transfer with VM=0)	R

3	VM	Descriptor Valid Mode. 0: V bit is ignored; 1: Support V bit. (Ignored in No-Descriptor Transfer)	RW
2	VIE	DMA Valid Error Interrupt Enable. 0: disable; 1: enable. (Ignored in No-Descriptor Transfer)	RW
1	TIE	Transfer Interrupt Enable (TIE). 0: disable interrupt; 1: enable interrupt.	RW
0	LINK	Descriptor Link Enable. 0: disable; 1: enable. (Ignored in No-Descriptor Transfer)	RW

Table 4-3 Detection Interval Length

RDIL	Description
0	Interval length is 0
1	Interval length is 2 transfer unit
2	Interval length is 4 transfer unit
3	Interval length is 8 transfer unit
4	Interval length is 12 transfer unit
5	Interval length is 16 transfer unit
6	Interval length is 20 transfer unit
7	Interval length is 24 transfer unit
8	Interval length is 28 transfer unit
9	Interval length is 32 transfer unit
10	Interval length is 48 transfer unit
11	Interval length is 60 transfer unit
12	Interval length is 64 transfer unit
13	Interval length is 124 transfer unit
14	Interval length is 128 transfer unit
15	Interval length is 200 transfer unit

4.2.7 DMA Descriptor Address (DDAn, n = 0 ~ 5)

This register is ignored in No-Descriptor Transfer.

Bits	Name	Description	RW
31:12	DBA	Descriptor Base Address.	RW
11:4	DOA	Descriptor Offset Address.	RW
3:0	Reserved	Write has no effect, read as zero.	R

4.2.8 DMA Control

Bits	Name	Description	RW
31:10	Reserved	Write has no effect, read as zero.	R
9:8	PM	Channel priority mode. 00: CH0 > CH1 > CH2 > CH3 > CH4 > CH5 01: CH0 > CH2 > CH3 > CH1 > CH4 > > CH5 10: CH2 > CH0 > CH1 > CH3 > CH4 > CH5 11: round robin	RW
7:4	Reserve	Write has no effect, read as zero.	R
3	HLT	Global halt status, halt occurs in any channel, the bit should set to 1. 0: no halt 1: halt occurred	RW
2	AR	Global address error status, address error occurs in any channel, the bit should be set to 1. 0: no address error 1: address error occurred	RW
1	Reserved	Write has no effect, read as zero.	R

0	DMAE	Global DMA transfer enable. 0: disable DMA channel transfer 1: enable DMA channel transfer	RW
---	------	--	----

4.2.9 DMA Doorbell (DDR)

Bits	Name	Description	RW
31:8	Reserved	Write has no effect, read as zero.	R
7:0	DBn	DMA Doorbell for each channel, n=0~5, for example DB0 is for DMA channel 0. Software set it to 1 and hardware clears it to 0. 0: disable DMA controller to fetch the first descriptor or DMA controller clears it to 0 as soon as it starts to fetch the descriptor 1: Write 1 to DDS will set the corresponding DBn bit to 1 and enable DMA controller to fetch the first descriptor For example, write 0x00000001 to DDS, DB0 bit is set to 1 and enable DMA channel 0 to fetch the first descriptor. Write 0 to DDS, no meaning.	RW

4.2.10 DMA Interrupt Pending (DIRQP)

Bits	Name	Description	RW
31:6	Reserved	Write has no effect, read as zero.	R
5:0	CIRQn	CIRQn (n=0~5) denotes pending status for corresponding channel. 0: no abnormal situation or normal DMA transfer is in progress 1: abnormal situation occurred or normal DMA transfer done	RW

4.3 DMA manipulation

4.3.1 Descriptor Transfer

To do proper Descriptor DMA transfer, do as following steps:

- 1 First of all, check whether the status of DMA controller are available, that is, for global control (DMAC), ensure that DMAC.AR=0 and DMAC.HLT=0; while for expected channels, ensure that DCSn.AR=0, DCSn.HLT=0, DCSn.TT=0, DTCn=0 and DCSn.INV=0.
- 2 Set DMAC.DMAE=1 and expected DCSn.CTE=1 to launch DAM transfer.
- 3 For Descriptor transfer, guarantee DCSn.NDES=0.
- 4 Build descriptor in memory. Write the first descriptor address in DDAn and the address must be 16Bytes aligned. The descriptor address includes two parts: Base and Offset address. If the descriptor is linked, the 32-bit address of next descriptor is composed of 20-bit Base address in DDAn and 8-bit Offset address in DES3.DOA and the four LSB is 0x0. See Table 4-4 for the detailed 4-word descriptor structure.
- 5 Set 1 to the corresponding bit in DDR to initiate descriptor fetch.
- 6 Hardware clears the corresponding bit in DDR as soon as it starts to fetch the descriptor.
- 7 If DES0.V =0 and DES0.VM=1, DMAC stops and set DCSn.INV=1. Otherwise, it waits for dma request from peripherals to start dma transfer.
- 8 After DMAC completes the current descriptor dma transfer, if DES0.VM=1, it clears DES0.V to 0 and writes back to memory. If DES0.Link=1, it sets DCSn.CT to 1, otherwise it sets DCSn.TT to 1. If the interrupt enabled, it will generates the corresponding interrupts.
- 9 If DES0.LINK=1, after DMAC completes the current descriptor dma transfer and return to fetch the next descriptor and continues dma transfer until completes the descriptor dma transfer which DES0.LINK=0.

Table 4-4 Descriptor Structure

Word	Bit	Name	Function
1st (DES0)	31	EACKS	External DMA DACKn output polarity select
	30	EACKM	External DMA DACKn output Mode select
	29-28	ERDM	External DMA request detection Mode
	27	EOPM	External DMA End of process mode
	26-24	Reserved	
	23	SAI	Source Address Increment
	22	DAI	Target Address Increment
	21-20	Reserved	
	19-16	RDIL	Request Detection Interval Length
	15-14	SP	Source port width
	13-12	DP	Target port width
	11	Reserved	
	10-8	TSZ	Transfer Data Size
	7	TM	Transfer Mode
	6-5	Reserved	
	4	V	Descriptor Valid
	3	VM	Descriptor Valid Mode
2	VIE	Descriptor Invalid Interrupt Enable	
1	TIE	Transfer Interrupt Enable	
0	LINK	Descriptor Link Enable	
2st (DES1)	31-0	DSA	Source Address
3st (DES2)	31-0	DTA	Target Address
4st (DES3)	31-24	DOA	Descriptor Offset address
	23-0	DTC	Transfer Counter

Figure 4-1 Descriptor Transfer Flow

4.3.2 No-Descriptor Transfer

To do proper DMA transfer, do as following steps:

- 1 First of all, check whether the status of DMA controller are available, that is, for global control (DMAC), ensure that DMAC.AR=0 and DMAC.HLT=0; while for expected channels, ensure that DCSn.AR=0, DCSn.HLT=0 and DCSn.TT=0 and DTCn=0.
- 2 For each channel n, initialize DSA_n, DTAn, DTCn, DRTn, DCSn, DCMn properly.
- 3 Set DMAC.DMAE=1 and expected DCSn.CTE=1 and DCSn.NDES=1 to launch DAM transfer.

For a channel with auto-request (DRTn.RT=0x8), the transfer begins automatically when the DCSn.CTE bit and DMAC.DMAE bit are set to 1. While for a channel with other request types, the transfer does not start until a transfer request is issued and detected.

For any channel n, The DTCn value is decremented by 1 for each successful transaction of a data unit. When the specified number of transfer data unit has been completed (DTCn = 0), the transfer ends normally. Meanwhile corresponding bit of DIRQP is set to 1. If DCMn.TIE bit is set to 1, an interrupt request is sent to the CPU. However, during the transfer, if a DMA address error occurs, the transfer is suspended, both DCSn.AR and DMAC.AR are set to 1 as well as corresponding bit of DIRQP. Then an interrupt request is sent to the CPU despite of DCMn.TIE.

Sometimes, for example, an UART parity error occurs for a channel that is transferring data between such UART and another terminal. In the case, both DCSn.HLT and DMAC.HLT are set to 1 and the transfer is suspended. Software should identify halt status by checking such two bits and re-configure DMA to let DMA rerun properly later.

4.4 DMA Requests

DMA transfer requests are normally generated from either the data transfer source or target, but also they can be issued by on-chip peripherals that are neither the source nor the target. There are two DMA transfer request types: auto-request, and on-chip peripheral request. For any channel n , its transfer request type is determined through $DRTn$.

4.4.1 Auto Request

When there is no explicit transfer request signal available, for example, memory-to-memory transfer or memory to some on-chip peripherals like GPIO, the auto-request mode allows the DMA to automatically generate a transfer request signal internally. Therefore, when DMA initialization done, once the $DMAC.DMAE$ and $DCSn.CTE$ are set to 1, the transfer begins immediately in channel n which $DRTn=0x8$.

4.4.2 On-Chip Peripheral Request

In the mode, transfer request signals come from on-chip peripherals. All request types except $0x8$ (value of DRT) belong to the mode. Both single and block transfer mode are available. Note that in single mode, the transfer byte number for one request detection according to $DCMn.RDIL$ must be equal or less than the byte number according to receive or transmit trigger value of source or target devices.

4.5 DMA Transfer Modes

Each channel can toggle between two transfer modes: single and block.

4.5.1 Single Mode

A channel with single mode will periodically detect the request signal according to presetting detection interval length (DCMn.RDIL). Moreover, during the transfer, after a transaction of a data unit (8-bit, 16-bit, 32-bit, 16-byte, or 32-byte), an internal arbitrator in the DMA will arbitrate all active channels again to select one to represent DMA's bus request to participate the AHB bus arbitration.

Above process will repeat when the channel captures the bus again until corresponding DCSn.TT bit equals to 1 or abnormal situation (address error, halt) occurs.

4.5.2 Block Mode

Once a channel with block mode captures the bus, it will do data transfer continuously until all data units are transferred or abnormal situation occurs. During the process, it does not release the bus so that neither other channels nor other bus masters can take up the bus. In the mode, the channel just detects the request signal once and corresponding DCMn.RDIL is ignored.

4.6 Channel Priorities

There are two priority modes: fixed, round robin.

4.6.1 Fixed Mode

The relative channel priorities are unvaried in the mode.

- CH0 > CH1 > CH2 > CH3 > CH4 > CH5 > CH6 > CH7
- CH0 > CH2 > CH3 > CH1 > CH4 > CH6 > CH7 > CH5
- CH2 > CH0 > CH1 > CH3 > CH6 > CH4 > CH5 > CH7

4.6.2 Round Robin Mode

In the mode, there are two priority groups: CH0~CH3 and CH4~CH7. Round robin is performed in each group, and CH0~CH3 always has higher priority than CH4~CH7.

Table 4-5 Relationship among DMA Transfer connection, request mode & transfer mode

Transfer Connection	Request Mode	Transfer Mode	Data Size (bits)	Channel
External memory or memory-mapped external device and on-chip peripheral module	Auto on-chip	Block/Single	8/16/32 16-byte/32-byte	0~5

4.7 Examples

4.7.1 Memory-to-memory auto request No-Descriptor Transfer

Suppose you want to do memory move between two different memory regions through channel 3, for example, moving 1KB data from address 0x20001000 to 0x20011000, do as following steps:

- 1 Check if (DMAC.AR==0 && DMAC.HLT==0 && DCS3.AR==0 && DCS3.HLT==0 && DCS3.CT==0 && DCS3.NDES=1 && DTC3==0).
- 2 If above condition is true, set value 0 to DCS3.CTE to disable the channel 3 temporarily.
- 3 Set source address 0x20001000 to DSA3 and target address 0x20011000 to DTA3.
- 4 Suppose the data unit is word, set transfer count number 256 (1024/4) to DTC3.
- 5 Set auto-request (0x8) to DRT3.
- 6 Up to now, only the most important channel control register DCM3 is left, set it carefully:
 - Set value 1 to SAI and DAI^{*1}.
 - Ignore RDIL because in the case there is no explicit request signal can be detected.
 - Set word size (0) to SP and DP^{*2}.
 - Set single mode (0) to TM^{*3}.
 - Set value 1 to TIE to let CPU do some post process after the transfer done.
- 7 Set value 1 to DCS3.CTE and DMAC.DMAE to launch the transfer in channels 3.
- 8 When the transfer terminates normally (DTC3==0 && DCS3.TT==1), DIRQP.CIRQ3 will automatically be set value 1 and an interrupt request will be sent to CPU.
- 9 When CPU grants the interrupt request, in the corresponding IRQ handler, software must clear the DCS3.CT to value 0, and the behavior will automatically clear DIRQP.CIRQ3.

NOTES:

- 1 Either source or target is a FIFO, must not enable corresponding address increment.
- 2 When either source or target need be accessed through EMC (external memory controller), the real port with of the device is encapsulated by EMC, so you can set any favorite port with for it despite of the real one.
- 3 Block mode may block bus for a long time, do not use the mode unless the data are emergency.

5 Clock Reset and Power Controller

5.1 Overview

The Clock & Power management block consists of three parts: Clock control, PLL control, and Power control, Reset control.

The Clock control logic can generate the required clock signals including CCLK for CPU, HCLK for the AHB bus peripherals, and PCLK for the APB bus peripherals. This chip has one Phase Locked Loops (PLL): for CCLK, HCLK, and PCLK, MSCLK, UHCCLK, LDCLK, LPCLK. The clock control logic can make slow clocks without PLL and connect/disconnect the clock to each peripheral block by software, which will reduce the power consumption.

For the power control logic, there are various power management schemes to keep optimal power consumption for a given task. The power management block can activate four modes: NORMAL mode, DOZE mode, IDLE mode, SLEEP mode.

For reset control logic, the reset module controls or distributes all of the system reset signals.

5.2 Clock Generation UNIT

The clock generation unit (CGU) contains one PLL driven by an external oscillator and the clock generation circuit from which the following clocks are derived:

Signal	Description
CCLK	Fast clock for internal operations such as executing instructions from the cache. It can be gated during doze and idle mode when all the criteria to enter a low power are met.
HCLK	System clock—This signal appears as the HCLK input to the CPU and the HCLK to the system. This is a continuous clock (when the system is not in sleep mode) It can be gated during Sleep mode when all the criteria to enter a low power are met.
PCLK	Peripheral clock – APB BUS device clock.
MCLK	Clock for EMC controller.
CKO	SDRAM Clock.
LDCLK	LCD device clock.
LPCLK	LCD pixel clock.
CIM_MCLK	Clock output from CIM module.
CIM_PCLK	Clock input to CIM module.
I2SCLK	I2S codec clock.
MSCCLK	MSC clock.
SSICLK	SSI clock.
EXCLK	12M clock output for UART I2C SSI TCU USB2.0-PHY.

Feature:

- On-chip 2MHz~24MHZ oscillator circuit
- On-chip 32.768KHZ oscillator circuit
- One On-chip phase-locked loops (PLL) with programmable multiplier
- CCLK, PCLK, HCLK, MCLK , CKO and UHCCLK, LDCLK, LPCLK, I2SCLK, MSCCLK frequency can be changed separately for software by setting registers
- SSI supports fast clock
- Switchable clock source
- Functional-unit clock gating

5.2.1 Pin Description

Name	I/O	Description
RTCLK_XI	Input	32.768KHZ Oscillator input signal
RTCLK_XO	Output	32.768KHZ Oscillator output signal
EXCLK	Input	Oscillator input signal
EXCLKO	Output	Oscillator output signal
CIM_MCLK	Output	Clock output from CIM module signal
CIM_PCLK	Input	Clock input to CIM module signal
LPCLK	Output	LCD pix clock signal
CKO	Output	SDRAM clock signal
MSC_CLK	Output	Clock output For MMC/SD Card signal
SSI_CLK	Output	Clock output from SSI module signal

5.2.2 CGU Block Diagram

Following figure illustrates a block diagram of CGU.

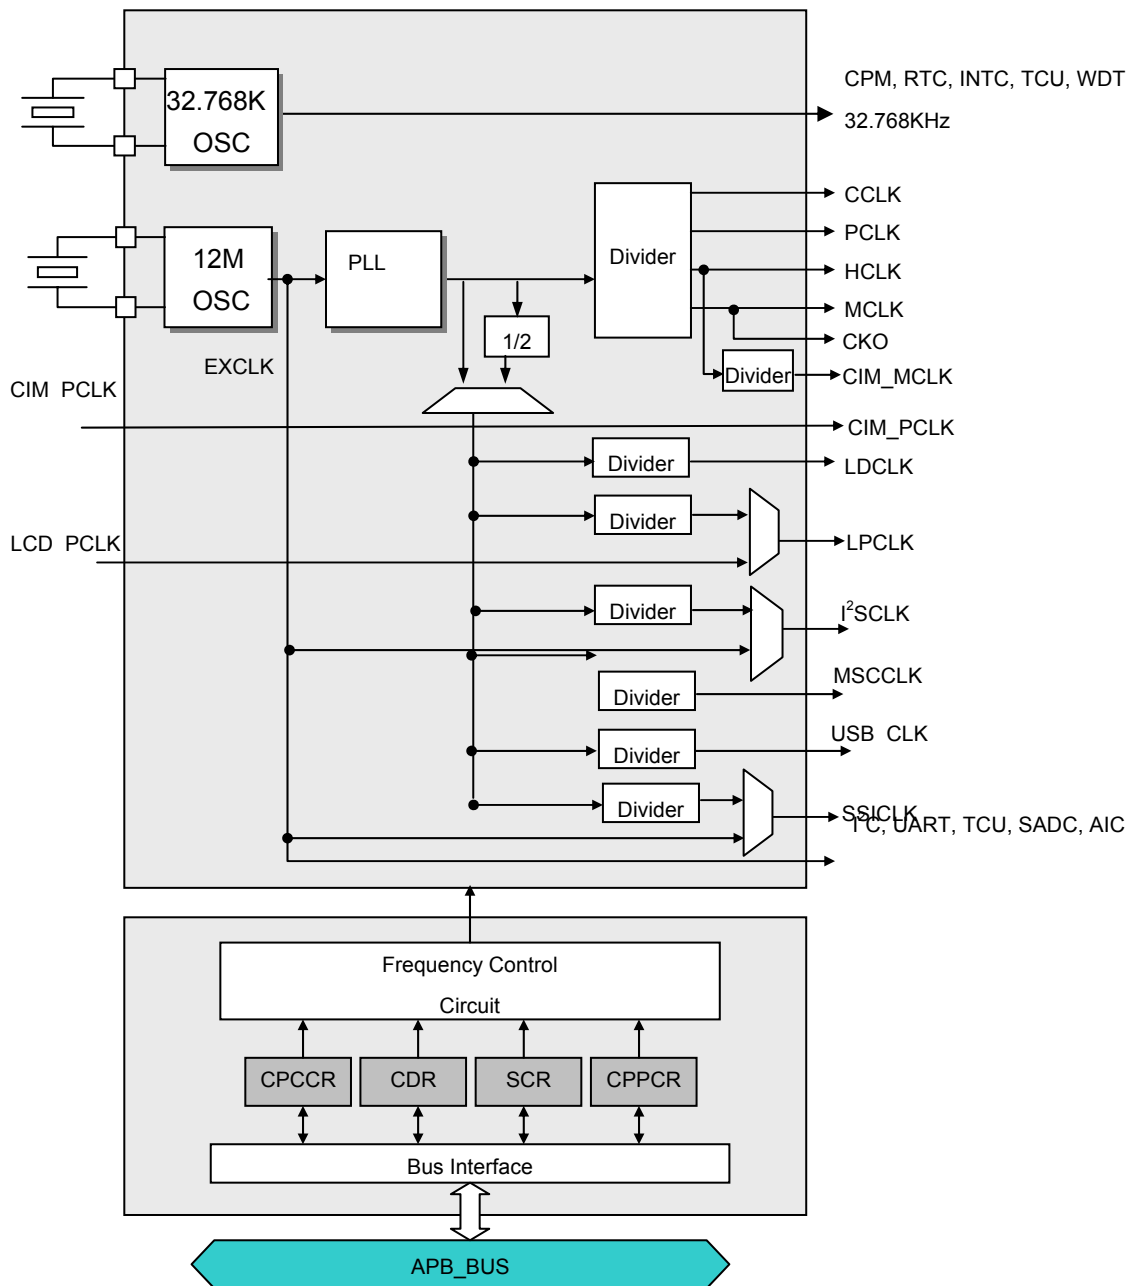

Figure 5-1 CGU Block Diagram

5.2.3 Clock Overview

There is an internal PLL in this chip. PLL input clock is an external input clock EXCLK. Theoretically, EXCLK can be 2MHz ~ 20MHz.

CCLK is CPU clock. It is usually the fastest clock in the chip. This clock represents the chip speed.

HCLK is for on chip high speed peripherals connected to AHB bus.

PCLK is for on chip slow speed peripherals connected to APB bus.

MCLK is external memory bus clock. MCLK represents the SDRAM speed.

CCLK, HCLK, PCLK and MCLK are synchronous clocks that may have different frequencies. They are from the same clock source, the on chip PLL output clock in most cases. HCLK frequency can be equal to CCLK or divided CCLK by an integer. PCLK frequency can be equal to HCLK or divided HCLK by an integer. MCLK frequency can be equal to or half of HCLK.

USB device and host controllers need a 48MHz USB clock. USB clock can be selected by software divided PLL output clock.

AC97 in AIC module needs a 12.288MHz BIT clock. It is input from the external AC97 CODEC chip or other clock source.

Besides PLL input, EXCLK also provides device clock or one of device clocks for many peripherals, such as, UART, I2C, TCU, SSI and WDT.

Device clock of MSC (MMC/SD) is taken from software divided PLL output clock.

LCD's device clock and pixel clock are generated from PLL output clock, which are divided by two independent dividers.

The slowest clock is RTCLK, which is usually 32768Hz.

5.2.4 CGU Registers

All CGU register 32bit access address is physical address.

Table 5-1 CGU Registers Configuration

Name	description	RW	Reset Value	Address	Access Size
CPCCR	Clock Control Register	RW	0x42040000	0x10000000	32
CPPCR	PLL Control Register	RW	0x28080011	0x10000010	32
I2SCDR	I2S device clock divider Register	RW	0x00000004	0x10000060	32

UHCCDR	UHC 48M clock divider Register	RW	0x00000004	0x1000006C	32
SSICDR	SSI clock divider Register	RW	0x00000004	0x10000074	32

5.2.4.1 Clock Control Register

The Clock Control Register (CPCCR) is a 32-bit read/write register, which controls CCLK, HCLK, PCLK, MCLK and LDCLK division ratios. It is initialized to 0x42040000 by any reset. Only word access can be used on CPCCR.

Bits	Name	Description	RW
31	I2CS	I2S Clock Source Selection. Selects the I2S clock source between PLL output and pin EXCLK. 0: I2S clock source is EXCLK 1: I2S clock source is PLL output divided by I2SDIV	RW
30	CKOEN	CKO Output Enable. Controls the output of CKO. 0: Disable CKO output. CKO is Hi-Z 1: Enable CKO output	RW

5.2.4.2 I2S device clock divider Register

I2S device clock divider Register (I2SCDR) is a 32-bit read/write register that specifies the divider of I2S device clock . This register is initialized to 0x00000004 only by any reset. Only word access can be used on I2SCDR.

Bits	Name	Description	RW
31:9	Reserved	Writes to these bits have no effect and always read as 0.	R
8:0	I2SCDR	Divider for I2S Frequency. Specified the I2S device clock division ratio, which varies from 1 to 512 (division ratio = I2SCDR + 1).	RW

5.2.4.3 LCD pix clock divider Register

LCD pix clock divider Register (LPCDR) is a 32-bit read/write register that specifies the divider of LCD pixel clock (LPCLK). This register is initialized to 0x00000004 only by any reset. Only word access can be used on LPCDR.

Bits	Name	Description	RW
31	LCS	LCD Pixel Clock Source Selection. Selects the LCD pixel clock source between divider and external clock input. 0: LCD pixel clock source is divider output 1: LCD pixel clock source is LCD_PCLK pin	RW
30:11	Reserved	Writes to these bits have no effect and always read as 0.	R
10:0	LPCDR	Divider for Pixel Frequency. Specified the LCD pixel clock (LPCLK) division ratio, which varies from 1 to 2048 (division ratio = LPCDR + 1).	RW

5.2.4.4 MSC device clock divider Register

MSC device clock divider Register (MSCCDR) is a 32-bit read/write register that specifies the divider of MSC device clock. This register is initialized to 0x00000004 only by any reset. Only word access can be used on MSCCDR.

Bits	Name	Description	RW
31:5	Reserved	Writes to these bits have no effect and always read as 0.	R
4:0	MSCCD R	Divider for MSC Frequency. Specified the MSC device clock division ratio, which varies from 1 to 32 (division ratio = MSCCDR + 1).	RW

5.2.4.5 UHC device clock divider Register

UHC device clock divider Register (UHCCDR) is a 32-bit read/write register that specifies the divider of UHC 48M device clock . This register is initialized to 0x00000004 only by any reset. Only word access can be used on UHCCDR.

Bits	Name	Description	RW
31:4	Reserved	Writes to these bits have no effect and always read as 0.	R
3:0	UHCCDR	Divider for UHC Frequency. Specified the UHC 48M device clock division ratio, which varies from 1 to 16 (division ratio = UHCCDR + 1).	RW

5.2.4.6 UHC PHY test point Register (internal used only)

5.2.4.7 SSI device clock divider Register

SSI device clock divider Register (SSICDR) is a 32-bit read/write register that specifies the divider of SSI device clock . This register is initialized to 0x00000004 only by any reset. Only word access can be used on SSICDR.

Bits	Name	Description	RW
31	SCS	SSI Clock Source Selection. Selects the SSI clock source between PLL output and pin EXCLK. 0: SSI clock source is pin EXCLK 1: SSI clock source is PLL output	RW
30:4	Reserved	Writes to these bits have no effect and always read as 0.	R
3:0	SSICDR	Divider for SSI Frequency. Specified the SSI device clock division ratio, which varies from 1 to 16 (division ratio = SSICDR + 1).	RW

5.2.4.8 PLL Control Register

The PLL Control Register (CPPCR) is a 32-bit read/write register, which controls PLL multiplier, on/off state and stabilize time. It is initialized to 0x28080011 only by any reset. Only word access can be used on CPPCR.

Bits	Name	Description	RW
31:23	PLLM	the PLL feedback 9-bit divider.	RW
22:18	PLLN	the PLL input 5-bit divider.	RW
17:16	PLLOD	00: divide by 1 01: divide by 2 10: divide by 2 11: divide by 4	RW
15:11	Reserved	Writes to these bits have no effect and always read as 0.	R
10	PLLS	PLL Stabilize Flag. 0: PLL is off or not stable 1: PLL is on and stable	R
9	PLLBP	PLL Bypass. If PPLEN is 1, set this bit to 1 will bypass PLL. The PLL is still running background but the source of associated dividers is switched to 12-M. If PPLEN is 0, set this bit to 1 has no effect. If PPLEN is 1, clear this bit to 0 will switch the source of associated dividers to PLL output.	RW
8	PPLEN	PLL Enable. When PPLEN is set to 1, PLL starts to lock phase. After PLL stabilizes, PLLS bit is set. If PLLBP is 0, the source of associated dividers, is switched to PLL output. When PPLEN is clear to 0, PLL is shut off and the source of associated dividers is switched to 12-MHz in spite of PLLBP bit.	RW
7:0	PLLST	PLL Stabilize Time. Specifies the PLL stabilize time by unit of RTCCLK (approximate 32kHz) cycles. It is used when change PLL multiplier or change PLL from off to on. It is initialized to H'11.	RW

5.2.5 PLL Operation

The PLL developed as a macro cell for clock generator. It can generate a stable high-speed clock from a slower clock signal. The output frequency is adjustable and can be up to 500MHz. The PLL integrates a phase frequency detector (PFD), a low pass filter (LPF), a voltage controlled oscillator (VCO) and other associated support circuitry. All fundamental building blocks as well as fully programmable dividers are integrated on the core. It is useful for clock multiplication of stable crystal oscillator sources and for de-skew clock signals.

The PLL block diagram is shown in following figure.

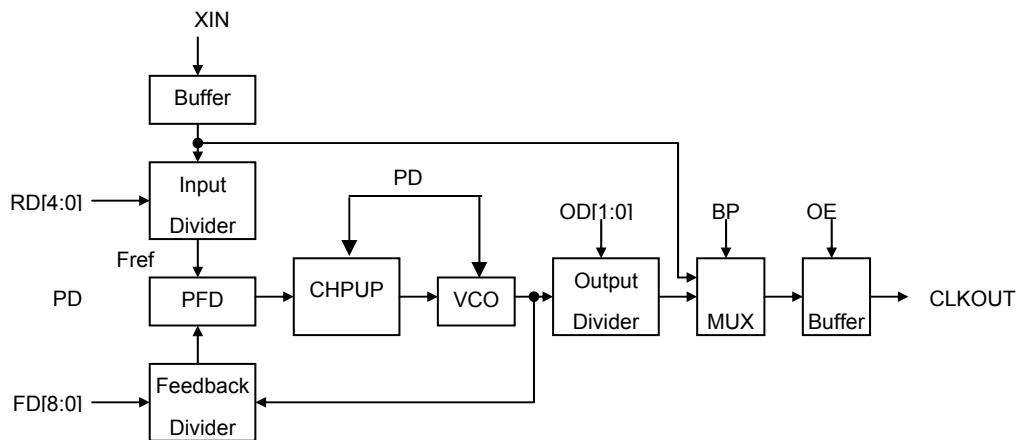

Figure 5-2 Block Diagram of PLL

5.2.5.1 PLL Configuration

PLL Divider Value Setting

There are 3 divider values (N, M and NO) to set the PLL output clock frequency CLKOUT:

- 1 Input Divider Value N.
 $N = PLLN \text{ of } CPPCR + 2$
- 2 Feedback Divider Value M.
 $M = PLLM \text{ of } CPPCR + 2$
- 3 Output Divider Value NO.

Output Divider Setting (OD)	Output Divider Value (NO)
0	1
1	2
2	2

3	4
---	---

- 4 The PLL output frequency, CLK_OUT, is determined by the ratio set between the value set in the input divider and the feedback divider. PLL output frequency CLK_OUT is calculated from the following equations:

$$\text{CLKOUT} = \text{XIN} \times (\text{M} / \text{N}) \times (1 / \text{NO})$$

$$\text{M} = \text{F0} * 1 + \text{F1} * 2 + \text{F2} * 4 + \text{F3} * 8 + \text{F4} * 16 + \text{F5} * 32 + \text{F6} * 64 + \text{F7} * 128 + \text{F8} * 256 + 2$$

$$\text{N} = \text{R0} * 1 + \text{R1} * 2 + \text{R2} * 4 + \text{R3} * 8 + \text{R4} * 16 + 2$$

$$\text{NO} = 2^{\text{od0} + \text{od1}}$$

Where:

- CLK_OUT represents the output frequency
- XIN represents PLL input frequency
- N represents input divider value
- M represents feedback divider value
- NO represents output divider value

< Attention >

- a) $1\text{MHZ} \leq \text{XIN}/\text{N} \leq 15\text{MHZ}$
- b) $100\text{MHZ} \leq \text{CLK_OUT} \times \text{NO} \leq 500\text{MHZ}$

5.2.5.2 PLL out clock frequency selection

PLL-freq = PLL-freq-raw / NO, where NO = 1, 2, 4.

PLL-freq-raw = EXCLK * M / N, where M = integer of 2 ~ 513, N = integer of 2 ~ 33.

So, to generate a specified PLL-freq, there are many valid sets of NO, M and N value.

Smaller PLL-freq-raw is better since it consumes less power. Reduce PLL-freq-raw from 200MHz to 100MHz saving a few milliwatts. Please beware not put PLL-freq-raw less than 100MHz.

If EXCLK is in small jitter, like a crystal-generated clock, a smaller N is better.

5.2.6 Main Clock Division Change Sequence

Main clock (CCLK, HCLK, PCLK and MCLK) frequencies can be changed separately or simultaneously by changing division ratio. Following conditions must be obeyed:

- 1 CCLK must be integral multiple of HCLK.
- 2 The frequency ratio of CCLK and HCLK can not be 24 and 32.
- 3 HCLK must be equal to MCLK or twice of MCLK.
- 4 HCLK and MCLK must be integral multiple of PCLK.

Don't violate this limitation, otherwise unpredictable error may occur.

In normal mode, if CE bit of CPCCR is 1, changing CDIV, HDIV, PDIV or MDIV will start a Division Change Sequence immediately. If CE bit of CPCCR is 0, changing CDIV, HDIV, PDIV or MDIV will not start Division Change Sequence.

5.2.7 Change Other Clock Frequencies

The divider of LCD device clock (LDCLK), LCD pixel clock (LPCLK), I2S device clock, SSI device clock, MSC device clock and USB clock can be changed by programming LDIV, LPCDR, I2SCDR, SSICDR, UHCCR, MSCCCR and UDIV, respectively.

Change LDIV LPCDR I2SCDR SSICDR UHCCR MSCCCR and UDIV as following steps:

- 1 Stop related devices with clock-gate function. Clock supplies to the devices are stopped.
- 2 Change LDIV, LPCDR, I2SCDR, SSICDR, UHCCR MSCCCR or UDIV. If CE is 1, clock frequencies are changed immediately. If CE is 0, clock frequencies are not changed until PLL Multiplier Change Sequence is started.
- 3 Cancel above clock-gate function.

5.2.8 Change Clock Source Selection

USB, I2S, SSI device clocks and LCD pix clock can be selected from two sources. Before change clock source, corresponding devices should be stopped using clock-gate function.

- 1 When USB clock source is changed (UCS bit of CPCCR), USB clock should be stopped.
- 2 When I2S clock source is changed (I2CS bit of CPCCR), AIC should be stopped.
- 3 When SSI clock source is changed (SCS bit of SSICDR), SSI should be stopped
- 4 When LCD pix clock source is changed (LCS bit of LPCDR), LCD should be stopped.

When UCS, I2CS, SCS, LCS bit is changed, clock source is changed immediately.

5.2.9 EXCLK Oscillator

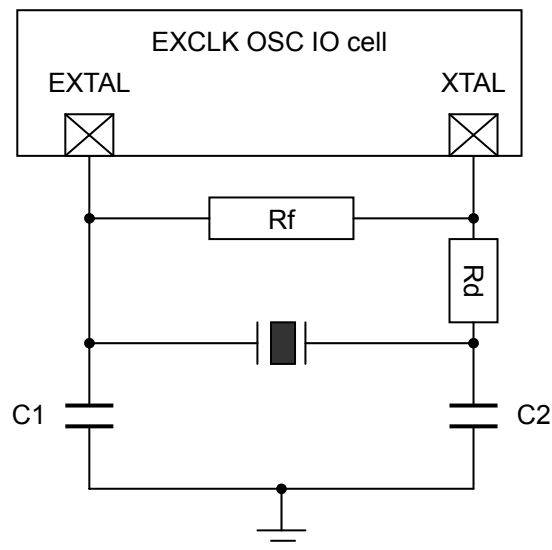

Figure 5-3 Oscillating circuit for fundamental mode

To turn on the oscillator, the oscillating circuit must provide the negative resistance ($-R_e$) at least five times the equivalent series resistance (ESR) of the crystal sample. For larger $-R_e$ value, faster turn on the crystal. Higher g_m provides larger $-R_e$ therefore can start-up the crystal with higher ESR for the same load capacitance (CL). However, it's required higher power consumption.

There are two key parameters to turn on oscillator. Which are CL and the maximum ESR at the target frequency? By reducing the CL, the $-R_e$ can be increased thus; shorter turn on time can be achieved. However, if CL is too small, the deviation from the target frequency will increase because of the capacitance variation. So, a trade-off relationship between short turn on time and small frequency deviation in deciding CL value. The smaller ESR of the crystal sample will reduce turn on time but the price is higher. The typical CL and ESR values for difference target frequencies are listed in Table 5-2.

Table 5-2 Typical CL and the corresponding maximum ESR

Target Frequency (Hz)	2M ~ 3M	3M ~ 6M	6M ~ 10M	10M ~ 20M
CL (pf)	25	20	16	12
Maximum ESR (ohm)	1K	400	100	80

Figure 5-3 shows the oscillating circuit is connected with the oscillator I/O cell. Components feedback resistor (R_f), damping resistor (R_d), C1 and C2 are used to adjust the turn on time, keep stability and accurate of the oscillator.

R_f is used to bias the inverter in the high gain region. It cannot be too low or the loop may not oscillate. For mega Hertz range applications, R_f of 1Mohm is applied.

R_d is used to increase stability, low power consumption, suppress the gain in high frequency region and also reduce $-Re$ of the oscillator. Thus, proper R_d cannot be too large to cease the loop oscillating.

C_1 and C_2 are deciding regard to the crystal or resonator CL specification. In the steady state of oscillating, CL is defined as $(C_1 * C_2) / (C_1 + C_2)$. Actually, the I/O ports, bond pad, and package pin all contribute the parasitic capacitance to C_1 and C_2 . Thus, CL can be rewrite to $(C_1' * C_2') / (C_1' + C_2')$, where $C_1' = (C_1 + C_{in, stray})$ and $C_2' = (C_2 + C_{out, stray})$. In this case, the required C_1 and C_2 will be reduced.

Notice, this oscillating circuit is for parallel resonate but not series resonate. Because C_1 , C_2 , R_d and R_f are varying with the crystal specifications; therefore there is no single magic number of all the applications.

5.3 Power Manager

In the Low-Power mode, part or whole processor is halted. This will reduce power consumption. The Power Management Controller contains low-power mode control and reset sequence control.

5.3.1 Low-Power Modes and Function

The processor supports six low-power modes and function:

- **NORMAL mode**
In Normal mode, all peripherals and the basic blocks including power management block, the CPU core, the bus controller, the memory controller, the interrupt controller, DMA, and the external master may operate completely. But, the clock to each peripheral, except the basic blocks, can be stopped selectively by software to reduce the power consumption.
- **DOZE mode**
DOZE mode is entered by setting DOZE bit of LCR to 1. In DOZE mode, clock is burst to CPU core and the clock duty is set by DUTY field of LCR. DOZE mode is canceled by reset, interrupt or clearing DOZE bit to 0. Continuous clock is supplied immediately after DOZE mode is canceled. The other Clocks except CCLK run continuously in DOZE mode.
- **IDLE mode**
In IDLE mode, the clock to the CPU core is stopped except the bus controller, the memory controller, the interrupt controller, and the power management block. To exit the IDLE mode, the any interrupts should be activated.
- **SLEEP mode**
In SLEEP mode, all clocks except RTC clock are disabled. PLL is disabled also. SLEEP mode is canceled by reset or interrupt. When SLEEP mode is canceled, PLL is restarted, the PLL needs clock stabilization time (PLL lock time). This PLL stabilization time is automatically inserted by the internal logic with lock time count register. and all clocks start operating after PLL stability time.
- **CLOCK GATE function**
CLOCK GATE function is used to gate specified on-chip module when it is not used. Set specified CLKG0~15 bits in CLKGR will enter specified CLK gate function. CLOCK gate function is canceled by reset or clearing specified CLKGR0~15 to 0.

5.3.2 Register Description

All PMC register 32bit access address is physical address.

Table 5-3 Power/Reset Management Controller Registers Configuration

Name	description	RW	Initial Value	Address	Access Size

LCR	Low Power Control Register	RW	0x000000F8	0x10000004	32
CLKGR	Clock Gate Register	RW	0x00000000	0x10000020	32
SCR	Sleep Control Register	RW	0x00001500	0x10000024	32

5.3.2.1 Low Power Control Register

The Low Power Control Register (LCR) is a 32-bit read/write register that controls low-power mode status. It is initialized to 0x000000F8 by any reset.

Bits	Name	Description	RW
31:8	Reserved	Writes to these bits have no effect and always read as 0.	R
7:3	DUTY	CPU Clock Duty. Control the CPU clock duty in doze mode. When the DUTY field is 0x1F, the clock is always on and when it is zero, the clock is always off. Set the DUTY field to 0 when the CPU will be disabled for an extended amount of time. 00000: 0/31 duty-cycle 00001: 1/31 duty-cycle 00010: 2/31 duty-cycle ... 11111: 31/31 duty-cycle	RW
2	DOZE	Doze Mode. Control the doze mode. When doze mode is canceled, this bit is cleared to 0 automatically. 0: Doze mode is off 1: Doze mode is on	RW
1:0	LPM	Low Power Mode. Specifies which low-power mode will be entered when SLEEP instruction is executed. Bit 1~0: 00: IDLE mode will be entered when SLEEP instruction is executed 01: SLEEP mode will be entered when SLEEP instruction is executed 10: Reserved 11: Reserved	RW

5.3.2.2 Clock Gate Register

The Clock Gate Register (CLKGR) is a 32-bit read/write register that controls the CLOCK GATE function of peripherals. It is initialized to 0x00000000 by any reset.

CLKGR
0x10000020

Bits	Name	Description	RW																																																			
31:16	Reserved	Writes to these bits have no effect and always read as 0.	R																																																			
15:0	CLKGR	Clock gate Bits. Controls the clock supplies to some peripherals. 5.3.2.3 Sleep Control Register (SCR)

The Sleep Control Register is a 32-bit read/write register that specifies some special controls of SLEEP mode. It is initialized to 0x00001500 by reset.

Bits	Name	Description	RW
31	Reserved	Writes to these bits have no effect and always read as 0.	R
30	Reserved	Writes to these bits have no effect and always read as 0.	R
31:16	Reserved	Writes to these bits have no effect and always read as 0.	R
15:8	O1ST	12MHz Oscillator Stabilize Time. This filed specifies the 12Mhz oscillator stabilize time by unit of 16 RTCCLK periods (oscillator stable time O1ST × 16 / 32768) cycles. It is initialized to H'15.	RW
7	SPENDH	Force UHC phy to enter suspend mode. 0: UHC phy hasn't forced to entered SUSPEND mode 1: UHC phy has forced to entered SUSPEND mode	RW
6	SPENDN	force UDC phy to enter suspend mode. 0: UDC phy has forced to entered SUSPEND mode 1: UDC phy hasn't forced to entered SUSPEND mode	RW
5	Reserved	Writes to these bits have no effect and always read as 0.	R
4	O1SE	12MHz Oscillator Sleep Mode Enable. This filed controls the state of the 12Mhz oscillator in Sleep mode. 0: 12M oscillator is disabled in Sleep mode 1: 12M oscillator is enabled in Sleep mode	RW
3:0	Reserved	Writes to these bits have no effect and always read as 0.	R

5.3.3 Doze Mode

Firstly, software should set the DUTY bits of LCR. Then set DOZE bit of LCR to 1 to enter doze mode. When slot controller of PMC indicates that the CPU clock's time-slot has expired, CPU is halted but its register contents are retained. During doze mode, program can modify clock duty-cycle according to core resource requirement. Clock control is in increments of approximately 3% (1/31).

Doze is exited by software, interrupt, reset or SLEEP instruction.

5.3.4 IDLE Mode

In normal or mode, when LPM bits in LCR are 0 and SLEEP instruction is executed, the processor enters idle mode. CPU is halted but its register contents are retained. All critical application must be finished and peripherals must be configured to generate interrupts when they need CPU attention.

The procedure of entering sleep mode is shown below:

- 1 Set LPM bits in LCR to 0.
- 2 Executes SLEEP instruction.
- 3 When current operation of CPU core has finished and CPU core is idle, CCLK supply to CPU core is stopped.

IDLE mode is exited by an interrupt (IRQ or on-chip devices) or a reset.

5.3.5 SLEEP Mode

In normal mode, when LPM bits in LCR is 1 and SLEEP instruction is executed, the processor enters SLEEP mode. CPU and on-chip devices are halted, except some wakeup-logic. PLL is shut off. Clock output from CKO pin is also stopped. SDRAM content is preserved by driving into self-refresh state. CPU registers and on-chip devices registers contents are retained.

Before entering SLEEP mode, software should ensure that all peripherals are not running. The procedure of entering SLEEP mode is shown below:

- 1 Set LPM bit in LCR to 1.
- 2 Execute a SLEEP instruction.
- 3 When current access on system bus complete, the arbiter will not grant any following request. EMC will drive SDRAM from auto-refresh mode to self-refresh mode.
- 4 When system bus is idle state and SDRAM is self-refresh mode, internal clock supplies are stopped.

SLEEP mode can be exited by an interrupt (IRQ or on-chip devices), WDT reset or a power-on reset via the RESET pin.

5.4 Reset Control Module

5.4.1 Register Description

All RCM register 32bit access address is physical address.

Name	description	RW	Initial Value	Address	Access Size
RSR	Reset Status Register	RW	0x????????	0x10000008	32

5.4.1.1 Reset Status Register (RSR)

The Reset Status Register (RSR) is a 32-bit read/write register which records last cause of reset. Each RSR bit is set by a different source of reset. Please refer to Reset Sequence Control for reset sources description.

Bits	Name	Description	RW
31:2	Reserved	Writes to these bits have no effect and always read as 0.	R
1	WR	WDT Reset. When a WDT reset is detected, WR is set and remains set until software clears it or another reset occurs. This bit can only be written with 0. Write with 1 will be ignored. 0: WDT reset has not occurred since the last time the software clears this bit 1: WDT reset has occurred since the last time the software clears this bit	RW
0	PR	Power On Reset. When a poweron reset via PRESET pin is detected, PR is set and remains set until software clears it or another reset occurs. This bit can only be written with 0. Write with 1 is ignored. 0: Power on reset has not occurred since the last time the software clears this bit 1: Power on reset has occurred since the last time the software clears this bit	RW

5.4.2 Power On Reset

Power on reset is generated when PRESET pin is driven to low. Internal reset is asserted immediately. All pins return to their reset states.

PRESET pin must be held low until power stabilizes and the 12MHz oscillator stabilize. CPU and peripherals are clocked by 12MHz oscillator output directly. PLL is reset to off state. All internal modules are initialized to their predefined reset states.

5.4.3 WDT Reset

WDT reset is generated when WDT overflow. Internal reset is asserted within two RTCCLK cycles. All pins return to their reset states.

Then WDT reset source is cleared because of internal reset. The internal reset is asserted for about 10 milliseconds. CPU and peripherals are clocked by 12MHz oscillator output directly. PLL is reset to off state.

6 Real-Time Clock (RTC)

6.1 Overview

The Real-Time Clock (RTC) unit can be operated in either chip main power is on or the main power is down but the RTC power is still on. In this case, the RTC power domain consumes only a few micro watts power.

The RTC contains a 32768Hz oscillator, the real time and alarm logic, and the power down and wakeup control logic.

6.1.1 Features

RTC module has following features:

- Embedded 32768Hz oscillator for 32k clock generation with an external 32k crystal
- 32-bits second counter
- Programmable and adjustable counter to generate accurate 1 Hz clock
- Alarm interrupt, 1Hz interrupt
- Stand alone power supply, work in hibernating mode
- Power down controller
- Alarm wakeup
- External pin wakeup with up to 2s glitch filter

6.1.2 Signal Descriptions

RTC has 5 signal IO pins and 1 power pin. They are listed and described in.

Pin Names	Pin Loc	IO	IO Cell Char.	Pin Description	Power
RTCLK		AI	32768Hz	RTCLK: 32768 clock input or OSC input	VDD _{RTC}
RTCLKO		AO		RTCLKO: OSC output	VDD _{RTC}
PWRON_		AO	~2mA, Open-Draw	PWRON_: Power on/off control of main power	VDD _{RTC}
WKUP_ PD29		AI AI	Schmitt	WKUP_: Wake signal after main power down PD29: GPIO group D bit 29, input/interrupt only	VDD _{RTC}
PPRST_		AI	Schmitt	PPRST_: RTC power on reset and RESET-KEY reset input	VDD _{RTC}
VDDRTC		P		VDDRTC: 3.3V power for RTC and hibernating mode controlling that never power down	-

RTCLK/RTCLKO pins: We have an embedded oscillator for 32768Hz crystal. These two pins are the crystal XTALI and XTALO connection pins. If an input clock is used instead, please input it to RTCLKO pin.

PWRON_ pin: this pin is used to control the main power on/off. Output low voltage means on and high-Z means off.

WKUP_ pin: hibernating mode wakeup input.

PPRST_ pin: This pin should be set to low voltage only in two cases.

- When RTC power is turned on (so that whole chip is power on)
- A RESET-KEY is pressed

Don't set this pin to low voltage when wakeup from hibernating mode. When entering/exiting to/from hibernating mode (in another word, in main power up/down procedure), please avoid putting both WKUP_ and PPRST_ in low voltage. Because the RTC registers, for instance, the second counter and others may be changed.

6.2 Register Description

Table 6-1 Registers for real time clock

Name	Description	RW	Reset Value	Address	Access Size
RTCCR	RTC Control Register	RW	0x00000081 ^{[1][2]}	0x10003000	32
RTCSR	RTC Second Register	RW	0x????????	0x10003004	32
RTCSAR	RTC Second Alarm Register	RW	0x????????	0x10003008	32
RTCGR	RTC Regulator Register	RW	0x0????????	0x1000300C	32

NOTES:

- 1 Unless otherwise stated, the reset value is for PPRST_ and Hibernating wakeup reset. WDT reset doesn't change the value.
- 2 The reset value can be either of 0x00000081, 0x00000091, 0x00000089, 0x00000099.

Table 6-2 Registers for hibernating mode

Name	Description	RW	Reset Value	Address	Access Size
HCR	Hibernate Control Register	RW	0x00000000 ^[1]	0x10003020	32
HWFCR	Wakeup filter counter Register in Hibernate mode	RW	0x0000????	0x10003024	32
HRCR	Hibernate reset counter Register in Hibernate mode	RW	0x0000????	0x10003028	32
HWCR	Wakeup control Register in Hibernate mode	RW	0x00000000 ^[1]	0x1000302C	32
HWRSR	Wakeup Status Register in Hibernate mode	RW	0x00000000 ^[1]	0x10003030	32
HSPR	Scratch pattern register	RW	0x????????	0x10003034	32

NOTE:

- [1]: Unless otherwise stated, the reset value is for PPRST_ and Hibernating wakeup reset. WDT reset doesn't change the value.

All these registers, include those for real time clock and for hibernating mode control, except otherwise stated, are implemented in 32k clock domain. When write to these registers, it needs about 35 ~ 65 us to actually change the register's value and allow the next write access. A bit RTCCR.WRDY is used to indicate it. When RCR.WRDY is 1, it means the previous write is finished, a right value can be read from the target register, and a new write access can be issued. So before any write access, please make sure RCR.WRDY = 1.

6.2.1 RTC Control Register (RTCCR)

RTCCR contains bits to configure the real time clock features. Unless otherwise stated, the reset value is for PPRST_ and Hibernating wakeup reset. WDT reset doesn't change the value.

RTCCR		0x10003000
Bit	31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0	
	Reserved	WRDY 1HZ 1HZIE AF AIE AE Reserved RTCE
RST	0 1 ^[1] 0 ^[1] 0 ^[1] ? ? 0 0 1	

NOTE:

These bits are reset in all resets: PPRST_ input pin reset, hibernating reset and WDT reset.

Bits	Name	Description	RW						
31:7	Reserved	Writes to these bits have no effect and always read as 0.	R						
7	WRDY	Write ready flag. It is 0 when a write is currently processing and the value has not been written to the writing target register. No write to any RTC registers can be issued in this case, or the result is undefined. The read value from the target register is also undefined. The reading is meaningful and another write can be issued when it is 1. Please reference to descriptions in 0 for some more details. This bit is read only and write to it is ignored.	R						
6	1HZ	1Hz flag. This bit is set by hardware once every 1 second through the 1Hz pulse if the real time clock is enabled (RTCCR.RTCE = 1). This bit can be cleared by software. Write 1 to this bit is ignored. Writing to this bit takes effect immediately without delay.	RW						
5	1HZIE	1Hz interrupt enable. Writing to this bit takes effect immediately without delay. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>1HZIE</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>1Hz interrupt is disabled</td> </tr> <tr> <td>1</td> <td>1Hz interrupt is enabled. RTC issues interrupt when 1HZ bit is set</td> </tr> </tbody> </table>	1HZIE	Description	0	1Hz interrupt is disabled	1	1Hz interrupt is enabled. RTC issues interrupt when 1HZ bit is set	RW
1HZIE	Description								
0	1Hz interrupt is disabled								
1	1Hz interrupt is enabled. RTC issues interrupt when 1HZ bit is set								
4	AF	Alarm flag. This bit is set by hardware when alarm match (RTCSR = RTCSAR) is found and alarm is enabled (RTCCR.AE = 1) and the real time clock is enabled (RTCCR.RTCE = 1). This bit can be cleared by software. Write 1 to this bit is ignored. Writing to this bit takes effect immediately.	RW						
3	AIE	Alarm interrupt enable. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>AIE</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Alarm interrupt is disabled</td> </tr> <tr> <td>1</td> <td>Alarm interrupt is enabled. RTC issues interrupt</td> </tr> </tbody> </table>	AIE	Description	0	Alarm interrupt is disabled	1	Alarm interrupt is enabled. RTC issues interrupt	RW
AIE	Description								
0	Alarm interrupt is disabled								
1	Alarm interrupt is enabled. RTC issues interrupt								

			when AF is set	
2	AE	Alarm enable.		RW
		AE	Description	
		0	Alarm function is disabled	
		1	Alarm function is enabled	
1	Reserved	Writes to these bits have no effect and always read as 0.		R
0	RTCE	Real time clock enable.		RW
		RTCE	Description	
		0	Real time clock function is disabled	
		1	Real time clock function is enabled	

6.2.2 RTC Second Register (RTCSR)

RTCSR is a 32-bit width second counter. It can be read and write by software. It is increased by 1 at every 1Hz pulse if the real time clock is enabled (RTCCR.RTCE = 1). When read, it should be read continued more than once and take the value if the adjacent results are the same. RTCSR is not initialized by any reset.

6.2.3 RTC Second Alarm Register (RTCSAR)

RTCSAR serves as a second alarm register. Alarm flag (RTCCR.AF) is set to 1 when the RTCSR equals the RTCSAR in the condition of alarm is enabled (RTCCR.AE = 1) and the real time clock is enabled (RTCCR.RTCE = 1). RTCSAR can be read and write by software and is not initialized by any reset.

6.2.4 RTC Regulator Register (RTCGR)

RTCGR is serves as the real time clock regulator, which is used to adjust the interval of the 1Hz pulse.

NOTE:

This bit is reset in all resets: PPRST_ input pin reset, hibernating reset and WDT reset.

Bits	Name	Description	RW						
31	LOCK	Lock bit. This bit is used to safeguard the validity of the data written into the RTCGR register. Once it is set, write to RTCGR is ignored. This bit can only be set by software and cleared by (any type of) resets. <table border="1" style="margin: 5px auto; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">LOCK</th> <th style="text-align: center;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>Write to RTCGR is allowed</td> </tr> <tr> <td style="text-align: center;">1</td> <td>Write to RTCGR is forbidden</td> </tr> </tbody> </table>	LOCK	Description	0	Write to RTCGR is allowed	1	Write to RTCGR is forbidden	RW
LOCK	Description								
0	Write to RTCGR is allowed								
1	Write to RTCGR is forbidden								
30:26	Reserved	Writes to these bits have no effect and always read as 0.	R						
25:16	ADJC	This field specifies how many times it needs to add one 32kHz cycle for the 1Hz pulse interval in every 1024 1Hz pulses. In other word, among every 1024 1Hz pulses, ADJC number of them are triggered in every (NC1HZ + 2) 32kHz clock cycles, (1024 – ADJC) number of them are triggered in every (NC1HZ + 1) 32kHz clock cycles.	RW						
15:0	NC1HZ	This field specifies the number plus 1 of the working 32kHz clock cycles are contained in the 1Hz pulse interval. In other word, 1Hz pulse is triggered every (NC1HZ + 1) 32kHz clock cycles, if RTCGR.ADJC = 0.	RW						

6.2.5 Hibernate Control Register (HCR)

HCR contains the bit to control the main chip power on/off. This register is reset by any reset.

Bits	Name	Description	RW									
31:1	Reserved	Writes to these bits have no effect and always read as 0.	R									
0	PD	Power down or power on bit. Besides writing by CPU, this bit will be set to 1 if an unknown reason main power supply is detected. This bit controls the PWRON_ pin level. When co-working with some external components, this bit is used for power management of this chip. It is supposed when 1 is written to this bit, the main power supply of the chip, except RTC power, will be shut down immediately. After this bit is set to 1, all registers in RTC module, except RTCCR.1HZ and RTCCR.1HZIE, cannot be changed by write access. This bit is cleared by reset pin reset and hibernating reset. The later one is asserted by wakeup procedure.	RW									
		<table border="1"> <thead> <tr> <th>PD</th> <th>PWRON_</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0 V</td> <td>No power down, keep power on</td> </tr> <tr> <td>1</td> <td>VDDRTC</td> <td>Power down enable, turn power off</td> </tr> </tbody> </table>	PD	PWRON_	Description	0	0 V	No power down, keep power on	1	VDDRTC	Power down enable, turn power off	
PD	PWRON_	Description										
0	0 V	No power down, keep power on										
1	VDDRTC	Power down enable, turn power off										

6.2.6 HIBERNATE mode Wakeup Filter Counter Register (HWFCR)

The HIBERNATE mode Wakeup Filter Counter Register (HWFCR) is a 32-bit read/write register .It filters the glitch generated by a dedicated wakeup pin. The HRCCR is initialized by PPRST_ and WDT reset.

Bits	Name	Description	RW
31:16	Reserved	Writes to these bits have no effect and always read as 0.	R
15:5	HWFCR	Wakeup pin effective minimum time in number of 32 RTCLK cycles, used as glitch filter logic. Maximum of 2 seconds.	RW
4:0	Reserved	Writes to these bits have no effect and always read as 0.	R

6.2.7 Hibernate Reset Counter Register (HRCR)

The Hibernate Reset Counter Register is a 32-bit read/write register that specifies hibernate reset assertion time. The HRCR is initialized by PPRST_ and WDT reset.

Bits	Name	Description	RW
31:12	Reserved	Writes to these bits have no effect and always read as 0.	R
11:5	HRCR	HIBERNATE Reset waiting time. Number of 32 RTCLK cycles. Maximum 125 ms.	RW
4:0	Reserved	Writes to these bits have no effect and always read as 0.	R

6.2.8 HIBERNATE Wakeup Control Register (HWCR)

The HIBERNATE Wakeup Control Register is a 32-bit read/write register that controls real time clock alarm wake up enable. The reset value is for PPRST_ and Hibernating wakeup reset. WDT reset doesn't change the value.

Bits	Name	Description	RW
31:1	Reserved	Writes to these bits have no effect and always read as 0.	R
0	EALM	RTC Alarm wakeup enable. 0: disable 1: enable	RW

6.2.9 HIBERNATE Wakeup Status Register (HWRSR)

The HIBERNATE Wakeup Status Register is a 32-bit read/write register that reflects wakeup status bits.

NOTES:

- 1 This reset value only for PPRST_. It is undefined in case of other resets.
- 2 This reset value only for HRST_. It is undefined in case of other resets.

Bits	Name	Description	RW						
31:6	Reserved	Writes to these bits have no effect and always read as 0.	R						
5	HR	<p>Hibernate Reset. When a Hibernate reset detected, HR is set and remains set until software clears it or another reset occurs. This bit can only be written with 0. Write with 1 is ignored.</p> <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 5px;"> <thead> <tr> <th style="width: 15%;">HR</th> <th style="width: 85%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>Hibernate reset has not occurred since the last time the software clears this bit</td> </tr> <tr> <td style="text-align: center;">1</td> <td>Hibernate reset has occurred since the last time the software clears this bit</td> </tr> </tbody> </table>	HR	Description	0	Hibernate reset has not occurred since the last time the software clears this bit	1	Hibernate reset has occurred since the last time the software clears this bit	RW
HR	Description								
0	Hibernate reset has not occurred since the last time the software clears this bit								
1	Hibernate reset has occurred since the last time the software clears this bit								
4	PPR	<p>PAD PIN Reset. When a PPRST_ is detected, PPR is set and remains set until software clears it or another reset occurs. This bit can only be written with 0. Write with 1 is ignored.</p> <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 5px;"> <thead> <tr> <th style="width: 15%;">PPR</th> <th style="width: 85%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>PPRST_ reset has not occurred since last time the software clears this bit</td> </tr> <tr> <td style="text-align: center;">1</td> <td>PPRST_ reset has occurred since last time the software clears this bit</td> </tr> </tbody> </table>	PPR	Description	0	PPRST_ reset has not occurred since last time the software clears this bit	1	PPRST_ reset has occurred since last time the software clears this bit	RW
PPR	Description								
0	PPRST_ reset has not occurred since last time the software clears this bit								
1	PPRST_ reset has occurred since last time the software clears this bit								
3:2	Reserved	Writes to these bits have no effect and always read as 0.	R						
1	PIN	Wakeup Pin Status bit. The bit is cleared when chip enters hibernating mode. It is set when exit the hibernating mode by wakeup pin. This bit can only be written with 0. Write with 1 is ignored.	RW						
0	ALM	RTC Alarm Status bit. The bit is cleared when chip enters hibernating mode. It is set when exit the hibernating mode by alarm. This bit can only be written with 0. Write with 1 is ignored.	RW						

6.2.10 Hibernate Scratch Pattern Register (HSPR)

This is a scratch register used to hold a pattern. The software can check the pattern is kept to know whether RTC power has ever been down and whether it is needed to setup the real time clock.

Bits	Name	Description	RW
31:0	PAT	The pattern.	RW

6.3 Time Regulation

Because of the inherent inaccuracy of crystal and other variables, the time counter may be inaccurate. This requires a slight adjustment. The application processor, through the RTCGR, lets you adjust the 1Hz time base to an error of less than 1ppm. Such that if the Hz clock were set to be 1Hz, there would be an error of less than 5 seconds per month.

To determine the value programmed into the RTCGR, you must first measure the output frequency at the oscillator multiplex (approximately 32 kHz) using an accurate time base, such as a frequency counter. This clock is externally visible by selecting the alternate function of GPIO[?]

To gain access to the clock, program this pin as an output and then switch to the alternate function. To trim the clock, divide the output of the oscillator by an integer value and fractional adjust it by periodically deleting clocks from the stream driving this integer divider.

After the true frequency of the oscillator is known, it must be split into integer and fractional portions. The integer portion of the value (minus one) is loaded into the DIV field of the RTCGR.

The fractional part of the adjustment is done by periodically deleting clocks from the clock stream driving the Hz divider. The trim interval period is hardwired to be 1024 1Hz clock cycles (approximately 17 minutes). The number of clocks (represented by ADC field of RTCGR) are deleted from the input clock stream per trim interval. If ADC is programmed to be zero, then no trim operations occur and the RTC is clocked with the raw 32 kHz clock. The relationship between the Hz clock frequency and the nominal 32 kHz clock (f_1 and f_{32K} , respectively) is shown in the following equation.

$$f_1 = \frac{2^{10} \times (DIV + 1)}{2^{10} \times (DIV + 1) + ADC} \times \frac{f_{32k}}{DIV + 1}$$

f_1 = actual frequency of 1Hz clock

f_{32k} = frequency of either 32.768KHz crystal output or 3.6864MHz crystal output further divided down to 32.914KHz

6.3.1 HIBERNATE Mode

When Software writes 1 to PD bit of HCR, the system at once enters HIBERNATE mode. The powers of CORE and IO are disconnected by PWRON_ pin, no power consumption to core and IO. When a wakeup event occurs, the core enters through a hibernate reset. Only CPM wake up logic and RTC is operating in HIBERNATE mode.

6.3.1.1 Procedure to Enter HIBERNATE mode

Before enter HIBERNATE mode, software must complete following steps:

- 1 Finish the current operation and preserve all data to flash.
- 2 Configure the wake-up sources properly by configure HWCSR.
- 3 Set HIBERNATE MODE. (Set PD bit in HCR to 1.)

6.3.1.2 Procedure to Wake-up from HIBERNATE mode

- 1 The internal hibernate reset signal will be asserted if one of the wake-up sources is issued.
- 2 Check RSR to determine what caused the reset.
- 3 Check PIN/ALM bits of HWCSR in order to know whether or not the power-up is caused by which wake-up from HIBERNATE mode.
- 4 Configure the SDRAM memory controller.
- 5 Recover the data from flash.

7 Interrupt Controller

7.1 Overview

This chapter describes the interrupt controller included in the XBurst Processor, explains its modes of operation, and defines its registers. The interrupt controller controls the interrupt sources available to the processor and contains the location of the interrupt source to allow software to determine source of all interrupts. It also determines whether the interrupts cause an IRQ to occur and masks the interrupts.

Features:

- Total 32 interrupt sources
- Each interrupt source can be independently enabled
- Priority mechanism to indicate highest priority interrupt
- All the registers are accessed by CPU
- Unmasked interrupts can wake up the chip in sleep mode

7.2 Register Description

Table 7-1 INTC Register lists the registers of Interrupt Controller. All of these registers are 32bit, and each bit of the register represents or controls one interrupt source that list in Table 7-1 INTC Register.

All INTC register 32bit access address is physical address.

Table 7-1 INTC Register

Name	Description	RW	Reset Value	Address	Access Size
ICSR	Interrupt controller Source Register	R	0x00000000	0x10001000	32
ICMR	Interrupt controller Mask Register	RW	0xFFFFFFFF	0x10001004	32
ICMSR	Interrupt controller Mask Set Register	W	0x????????	0x10001008	32
ICMCR	Interrupt controller Mask Clear Register	W	0x????????	0x1000100C	32
ICPR	Interrupt controller Pending Register	R	0x00000000	0x10001010	32

7.2.1 Interrupt Controller Source Register (ICSR)

This register contains all the interrupts' status. A "1" indicates that the corresponding interrupt is pending. A "0" indicates that the interrupt is not pending now. The register is read only.

ICSR		0x10001000																														
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits Of ICSR	Description
0	The corresponding interrupt source is not pending.
1	The corresponding interrupt source is pending.

7.2.2 Interrupt Controller Mask Register (ICMR)

This register is used to mask the interrupt input sources and defines which active sources are allowed to generate interrupt requests to the processor. Its value can be changed either by writing ICMCR and ICMCR or by writing itself. The masked interrupts are invisible to the processor.

ICMR		0x10001004																															
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits Of ICMCR	Description
0	Ignore.
1	Will clear the corresponding interrupt mask bit.

7.2.5 Interrupt Controller Pending Register (ICPR)

This register contains the status of the interrupt sources after masking. This register is read only.

ICPR		0x10001010
Bit	31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0	
	Reserved LCD IPU GPIO0 GPIO1 GPIO2 GPIO3 UDC TCU0 TCU1 TCU2 DMA Reserved AIC CIM SSI RTC MSC Reserved SADC Reserved Reserved UART0 Reserved Reserved Reserved Reserved Reserved UHC EMC I2C Reserved	
RST	0 0	

Bits Of ICPR	Description
0	The corresponding interrupt is not active or is masked.
1	The corresponding interrupt is active and is not masked to the processor.

NOTE: Reserved bits in ICMR, ICMSR and ICMCR are normal bits to be written into and read out. Reserved bits in ICSR and ICPR are read-only and always 0.

7.3 Software Considerations

The interrupt controller is reflecting the status of interrupts sources in the peripheral.

Software should perform the task - determine the interrupt source from in ICPR. In this chip, pending interrupts have two levels in structure. Interrupting module in the system that contains more than one interrupt sources need software to determine how to service it by reading interrupt status registers within it.

In the interrupt handler, the serviced interrupt source needs to be cleared in the interrupting device. In order to make certain the cleared source request status has been reflected at the corresponding ICPR bit, software should wait enough time before exiting interrupt state.

The procedure is described following:

- 1 Interrupt generated.
- 2 CPU query interrupt sources, saves the current environment and then goes to interrupt common service routine.
- 3 Get ICPR.
- 4 Find the highest priority interrupt and vector it. (The software decides which one has the highest priority)
- 5 Mask the chosen interrupt by writing the register ICMSR.
- 6 Enable the system interrupt to allow the interrupt nesting.(software decided)
- 7 Execute the interrupt handler and unmask it by writing the register ICMCR when exit the handler.
- 8 CPU restores the saved environment and exits the interrupt state.

8 Timer/Counter Unit

8.1 Overview

The TCU (Timer/Counter with PWM output) contains 8 channels of 16-bit programmable timers (timers 0 to 7). They can be used as Timer or PWM.

TCU has the following features:

- Six independent channels, each consisting of
 - Counter
 - Data register (FULL and HALF)
 - Control register
- Independent clock for each counter, selectable by software
 - PCLK, EXTAL and RTCCLK can be used as the clock for counter
 - The division ratio of the clock can be set to 1, 4, 16, 64, 256 and 1024 by software
- FULL interrupt and HALF interrupt can be generated for each channel using the compare data registers
 - Timer 0 and Timer 1 have separated interrupt
 - Timer 2-7 has one interrupt in common
 - Timer 0-7 can be used as PWM (Set the initial signal level)

8.2 Pin Description

Table 8-1 PWM Pins Description

Name	I/O	Description
PWM [7:0]	Output	PWM channel output signals.

8.3 Register Description

In this section, we will describe the registers in timer. Following table lists all the registers definition. All timer register's 32bit address is physical address. And detailed function of each register will be described below.

Name	Description	RW	Reset Value	Address	Access Size
TSR	Timer STOP Register	R	0x00	0x1000201C	8
TSSR	Timer STOP Set Register	W	0x00	0x1000202C	8

2	EXT_EN	Select EXTAL as the timer clock input. 1: Enable	RW																																

		0: Disable	
1	RTC_EN	Select RTCCLK as the timer clock input. 1: Enable 0: Disable	RW
0	PCK_EN	Select PCLK as the timer clock input. 1: Enable 0: Disable	RW

NOTE: The input clock of timer and the PCLK should keep to the rules as follows:

Input clock of timer: IN_CLK	Clock generated from the frequency divider (PRESCALE): DIV_CLK
PCK_EN == 0, RTC_EN == 1 and EXT_EN == 0 (IN_CLK = RTCCLK)	$f_{DIV_CLK} < \frac{1}{2} f_{PCLK}$
PCK_EN == 0, RTC_EN == 0 and EXT_EN == 1 (IN_CLK = EXTAL)	$f_{DIV_CLK} < \frac{1}{2} f_{PCLK}$
PCK_EN == 1, RTC_EN == 0 and EXT_EN == 0 (IN_CLK = PCLK)	ANY

8.3.2 Timer Data FULL Register (TDFR)

The comparison data FULL registers TDFR is used to store the data to be compared with the content of the up-counter TCNT. This register can be directly read and written. (Default: indeterminate)

8.3.3 Timer Data HALF Register (TDHR)

The comparison data HALF registers TDHR is used to store the data to be compared with the content of the up-counter TCNT. This register can be directly read and written. (Default: indeterminate)

8.3.4 Timer Counter (TCNT)

TCNT is a 16-bit read/write register. The up-counter TCNT can be reset to 0 by software and counts up using the prescaler output clock. When TCNT count up to equal to TDFR, it will reset to 0 and continue to count up. The data can be read out at any time. The counter data can be written at any time. This makes it possible to change the interrupt and/or clock output cycles temporarily. (Default: indeterminate)

8.3.5 Timer Counter Enable Register (TER)

The TER is an 8-bit read-only register. It contains the counter enable control bits for each channel. It is initialized to 0x00 by any reset. It can only be set by register TESR and TECR. Since the timer enable control bits are located in the same addresses, two or more timers can be started at the same time.

Bits	Name	Description	RW
7	TCEN 7	Enable the counter in timer 7. 1: Begin counting up 0: Stop counting up	R
6	TCEN 6	Enable the counter in timer 6. 1: Begin counting up 0: Stop counting up	R
5	TCEN 5	Enable the counter in timer 5. 1: Begin counting up 0: Stop counting up	R
4	TCEN 4	Enable the counter in timer 4. 1: Begin counting up 0: Stop counting up	R
3	TCEN 3	Enable the counter in timer 3. 1: Begin counting up 0: Stop counting up	R
2	TCEN 2	Enable the counter in timer 2. 1: Begin counting up 0: Stop counting up	R
1	TCEN 1	Enable the counter in timer 1. 1: Begin counting up 0: Stop counting up	R
0	TCEN 0	Enable the counter in timer 0. 1: Begin counting up 0: Stop counting up	R

8.3.6 Timer Counter Enable Set Register (TESR)

The TCCSR is an 8-bit write-only register. It contains the counter enable set bits for each channel. Since the timer enable control set bits are located in the same addresses, two or more timers can be started at the same time.

Bits	Name	Description	RW
7	TCST 7	Set TCEN 7 bit of TER. 1: Set TCEN 7 bit to 1 0: Ignore	W
6	TCST 6	Set TCEN 6 bit of TER. 1: Set TCEN 6 bit to 1 0: Ignore	W
5	TCST 5	Set TCEN 5 bit of TER. 1: Set TCEN 5 bit to 1 0: Ignore	W
4	TCST 4	Set TCEN 4 bit of TER. 1: Set TCEN 4 bit to 1 0: Ignore	W
3	TCST 3	Set TCEN 3 bit of TER. 1: Set TCEN 3 bit to 1 0: Ignore	W
2	TCST 2	Set TCEN 2 bit of TER. 1: Set TCEN 2 bit to 1 0: Ignore	W
1	TCST 1	Set TCEN 1 bit of TER. 1: Set TCEN 1 bit to 1 0: Ignore	W
0	TCST 0	Set TCEN 0 bit of TER. 1: Set TCEN 0 bit to 1 0: Ignore	W

8.3.7 Timer Counter Enable Clear Register (TECR)

The TECR is an 8-bit write-only register. It contains the counter enable clear bits for each channel. Since the timer enable clear bits are located in the same addresses, two or more timers can be stop at the same time.

Bits	Name	Description	RW
7	TCCL 7	Set TCEN 7 bit of TER. 1: Set TCEN 7 bit to 0 0: Ignore	W
6	TCCL 6	Set TCEN 6 bit of TER. 1: Set TCEN 6 bit to 0 0: Ignore	W
5	TCCL 5	Set TCEN 5 bit of TER. 1: Set TCEN 5 bit to 0 0: Ignore	W
4	TCCL 4	Set TCEN 4 bit of TER. 1: Set TCEN 4 bit to 0 0: Ignore	W
3	TCCL 3	Set TCEN 3 bit of TER. 1: Set TCEN 3 bit to 0 0: Ignore	W
2	TCCL 2	Set TCEN 2 bit of TER. 1: Set TCEN 2 bit to 0 0: Ignore	W
1	TCCL 1	Set TCEN 1 bit of TER. 1: Set TCEN 1 bit to 0 0: Ignore	W
0	TCCL 0	Set TCEN 0 bit of TER. 1: Set TCEN 0 bit to 0 0: Ignore	W

8.3.8 Timer Flag Register (TFR)

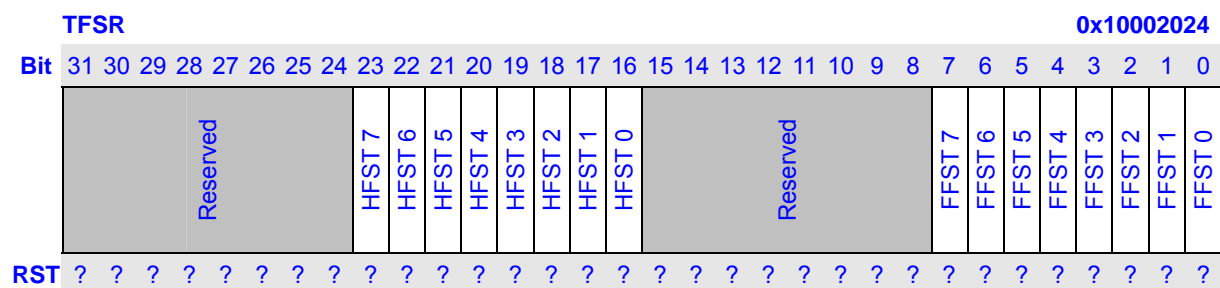

The TFR is a 32-bit read-only register. It contains the comparison match flag bits for all the channels. It can also be set by register TFSR and TFCR. It is initialized to 0x00000000 by any reset.

Bits	Name	Description	RW
31:24	Reserved	These bits always read 0, and written are ignored.	R
23:16	HFLAG 7~0	HALF comparison match flag. (TCNT = TDHR) 1: Comparison match 0: Comparison not match	R
15:8	Reserved	These bits always read 0, and written are ignored.	R
7:0	FFLAG 7~0	FULL comparison match flag. (TCNT = TDFR) 1: Comparison match 0: Comparison not match	R

8.3.9 Timer Flag Set Register (TFSR)

The TFSR is a 32-bit write-only register. It contains the comparison match flag set bits for all the channels.

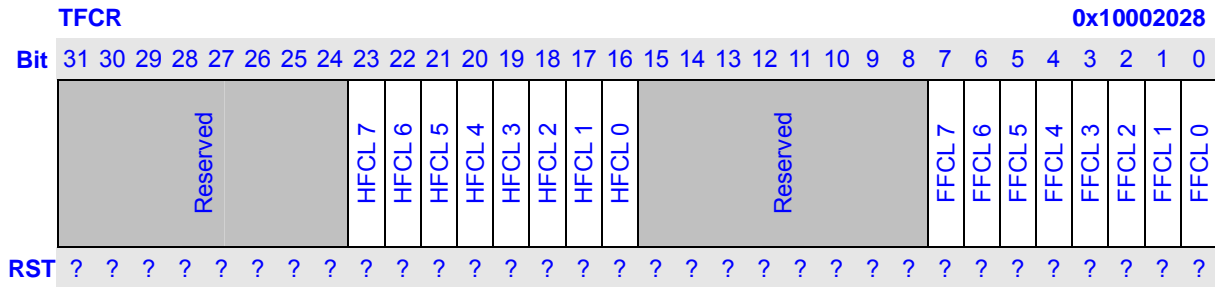

Bits	Name	Description	RW
31:22	Reserved	-	-
23:16	HFST 7~0	Set HFLAG n bit of TFR. 1: Set HFLAG n bit to 1 0: Ignore	W
15:8	Reserved	-	-
7:0	FFST 7~0	Set FFLAG n bit of TFR.	W

		1: Set FFLAG n bit to 1 0: Ignore	
--	--	--------------------------------------	--

8.3.10 Timer Flag Clear Register (TFCR)

The TFCR is a 32-bit write-only register. It contains the comparison match flag clear bits for all the channels.

Bits	Name	Description	RW
31:24	Reserved	-	-
23:16	HFCL 7~0	Set HFLAG n bit of TFR. 1: Set FFLAG n bit to 0 0: Ignore	W
15:8	Reserved	-	-
7:0	FFCL 7~0	Set FFLAG n bit of TFR. 1: Set FFLAG n bit to 0 0: Ignore	W

8.3.11 Timer Mask Register (TMR)

The TMR is a 32-bit read-only register. It contains the comparison match flag bits for all the channels. It is initialized to 0x00000000 by any reset. It can only be set by register TMSR and TMCR.

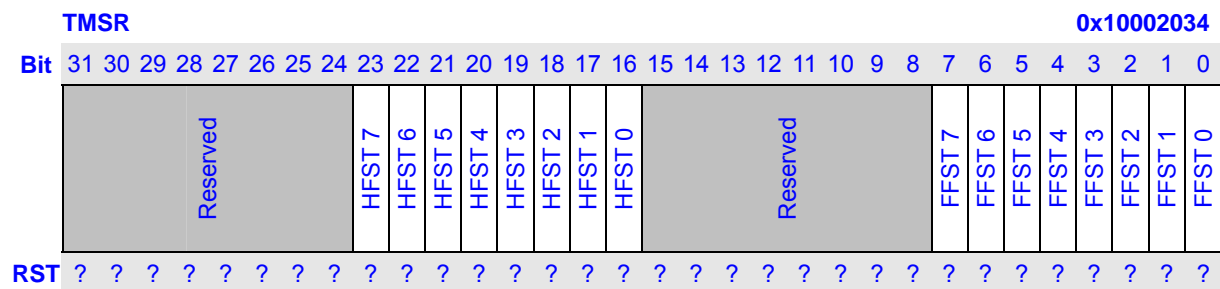

Bits	Name	Description	RW
31:24	Reserved	These bits always read 0, and written are ignored.	R
23:16	HMASK 7~0	HALF comparison match interrupt mask.	R

		1: Comparison match interrupt mask 0: Comparison match interrupt not mask	
15:8	Reserved	These bits always read 0, and written are ignored.	R
7:0	FMASK 7~0	FULL comparison match interrupt mask. 1: Comparison match interrupt mask 0: Comparison match interrupt not mask	R

8.3.12 Timer Mask Set Register (TMSR)

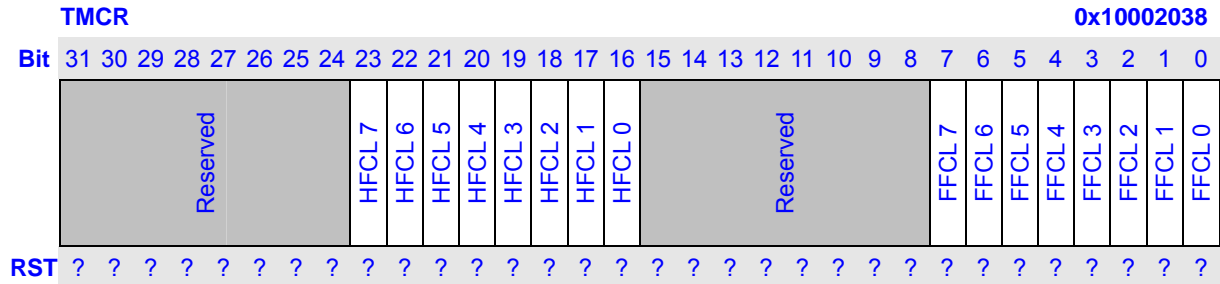

The TMSR is a 32-bit write-only register. It contains the comparison match flag set bits for all the channels.

Bits	Name	Description	RW
31:24	Reserved	-	-
23:16	HMST 7~0	Set HMASK n bit of TMR. 1: Set HMASK n bit to 1 0: Ignore	W
15:8	Reserved	-	-
7:0	FMST 7~0	Set FMASK n bit of TMR. 1: Set FMASK n bit to 1 0: Ignore	W

8.3.13 Timer Mask Clear Register (TMCR)

The TMCR is a 32-bit write-only register. It contains the comparison match flag clear bits for all the channels.

Bits	Name	Description	RW
31:24	Reserved	-	-
25:16	HMCL 7~0	Set HMASK n bit of TMR. 1: Set HMASK n bit to 0 0: Ignore	W
15:8	Reserved	-	-
7:0	FMCL 7~0	Set FMASK n bit of TMR. 1: Set FMASK n bit to 0 0: Ignore	W

8.3.14 Timer Stop Register (TSR)

The TSR is a 32-bit read-only register. It contains the timer stop control bits for each channel and WDT timer. It is initialized to 0x00000000 by any reset. It can only be set by register TSSR and TSCR. If set, clock supplies to timer n / WDT timer is stopped, and registers of the timer/WDT cannot be accessed also.

Bits	Name	Description	RW
31:17	Reserved	These bits always read 0, and written are ignored.	R
16	WDTS	1: The clock supplies to WDT is stopped 0: The clock supplies to WDT is supplied	R
15:8	Reserved	These bits always read 0, and written are ignored.	R

7	STOP 7	1: The clock supplies to timer 7 is stopped 0: The clock supplies to timer 7 is supplied	R
6	STOP 6	1: The clock supplies to timer 6 is stopped 0: The clock supplies to timer 6 is supplied	R
5	STOP 5	1: The clock supplies to timer 5 is stopped 0: The clock supplies to timer 5 is supplied	R
4	STOP 4	1: The clock supplies to timer 4 is stopped 0: The clock supplies to timer 4 is supplied	R
3	STOP 3	1: The clock supplies to timer 3 is stopped 0: The clock supplies to timer 3 is supplied	R
2	STOP 2	1: The clock supplies to timer 2 is stopped 0: The clock supplies to timer 2 is supplied	R
1	STOP 1	1: The clock supplies to timer 1 is stopped 0: The clock supplies to timer 1 is supplied	R
0	STOP 0	1: The clock supplies to timer 0 is stopped 0: The clock supplies to timer 0 is supplied	R

8.3.15 Timer Stop Set Register (TSSR)

The TCSR is an 8-bit write-only register. It contains the timer stop set bits for each channel and WDT timer. Since the timer stop control set bits are located in the same addresses, two or more timers can be started at the same time.

Bits	Name	Description	RW
31:17	Reserved	-	-
16	WDTS	Set WDTS bit of TSR. 1: Set WDTS bit to 1 0: Ignore	W
15:8	Reserved	-	-
7	STPS 7	Set STOP 7 bit of TSR. 1: Set STOP 7 bit to 1 0: Ignore	W
6	STPS 6	Set STOP 6 bit of TSR. 1: Set STOP 6 bit to 1 0: Ignore	W

5	STPS 5	Set STOP 5 bit of TSR. 1: Set STOP 5 bit to 1 0: Ignore	W
4	STPS 4	Set STOP 4 bit of TSR. 1: Set STOP 4 bit to 1 0: Ignore	W
3	STPS 3	Set STOP 3 bit of TSR. 1: Set STOP 3 bit to 1 0: Ignore	W
2	STPS 2	Set STOP 2 bit of TSR. 1: Set STOP 2 bit to 1 0: Ignore	W
1	STPS 1	Set STOP 1 bit of SR. 1: Set STOP 1 bit to 1 0: Ignore	W
0	STPS 0	Set STOP 0 bit of TSR. 1: Set STOP 0 bit to 1 0: Ignore	W

8.3.16 Timer Stop Clear Register (TSCR)

The TSCR is an 8-bit write-only register. It contains the timer stop clear bits for each channel and WDT timer. Since the timer stop clear bits are located in the same addresses, two or more timers can be stop at the same time.

Bits	Name	Description	RW
31:17	Reserved	-	-
16	WDTSC	Set WDTS bit of TSR. 1: Set WDTS bit to 0 0: Ignore	W
15:8	Reserved	-	-
7	STPC 7	Set STOP 7 bit of TSR. 1: Set STOP 7 bit to 0 0: Ignore	W
6	STPC 6	Set STOP 6 bit of TSR.	W

		1: Set STOP 6 bit to 0 0: Ignore	
5	STPC 5	Set STOP 5 bit of TSR. 1: Set STOP 5 bit to 0 0: Ignore	W
4	STPC 4	Set STOP 4 bit of TSR. 1: Set STOP 4 bit to 0 0: Ignore	W
3	STPC 3	Set STOP 3 bit of TSR. 1: Set STOP 3 bit to 0 0: Ignore	W
2	STPC 2	Set STOP 2 bit of TSR. 1: Set STOP 2 bit to 0 0: Ignore	W
1	STPC 1	Set STOP 1 bit of TSR. 1: Set STOP 1 bit to 0 0: Ignore	W
0	STPC 0	Set STOP 0 bit of TSR. 1: Set STOP 0 bit to 0 0: Ignore	W

8.4 Operation

8.4.1 Basic Operation

The value of TDFR should be bigger than TDHR, and the minimum settings are TDHR = 0 and TDFR = 1. In this case, the timer output clock cycle is the input clock $\times 1/2$. If TDHR > TDFR, no comparison TFHR signal is generated.

Before the timer counter begins to count up, we need to do as follows:

If you want to use PWM you should keep TCSR.PWM_EN to be 0 before you initial TCU.

- 1 Setting TCSR.
 - a Writing TCSR.INITL to initialize PWM output level.
 - b Writing TCSR.SD to setting the shutdown mode (Abrupt shutdown or Graceful shutdown).
 - c Writing TCSR.PRESCALE to set TCNT count clock frequency.
- 2 Setting TCNT, TDHR and TDFR.
- 3 Setting TCSR.
 - a Writing TCSR.PWM_EN to set whether enable PWM or disable PWM.
 - b Writing TCSR.EXT_EN, TCSR.RTC_EN or TCSR.PCK_EN to 1 to select the input clock and enable the input clock. Only one of TCSR.EXT_EN, TCSR.RTC_EN and TCSR.PCK_EN can be set to 1.

After initialize the register of timer, we should start the counter as follows:

- 4 Setting the TESR.TCST bit to 1 to enable the TCNT.

NOTE: The input clock and PCLK should follow the rules advanced before.

8.4.2 Disable and Shutdown Operation

Setting the TEER.TCCL bit to 1 to disable the TCNT.

8.4.3 Pulse Width Modulator (PWM)

Timer 0~7 can be used as Pulse Width Modulator (PWM). The PWM can be used to control the back light inverter or adjust bright or contrast of LCD panel.

FULL comparison match signal and HALF comparison match signal can determine an attribute of the PWM_OUT waveform. FULL comparison match signal specifies the clock cycle for the PWM module clock. HALF comparison match signal specifies the duty ratio for the PWM module clock.

8.4.4 The flow of using TCU5

Here is the basic flow of using TCU5.

Step 1: make sure the counter clock is stop.

Set `TMR.FMASK5 = 1`, `TMR.HMASK5 = 1`; `TCSR5.PRESCALE = 0`;
`TCSR5.RTC_EN = 0`, `TCSR5.EXT_EN = 0`, `TCSR5.PCK_EN = 0`.

Step 2: Initial TDFR5 and TDHR5. These registers must be initialed in case of the counter clock is stopped. Only abrupt shutdown mode can be used, which needs set `TCSR5.SD` to 1. To use PWM output, set `TCSR5.INITL` to choose start level.

Step 3: Initial TCNT5 in case of select and enable pclk without dividing as the counter clock
`TCSR5.RTC_EN = 0`, `TCSR5.EXT_EN = 0`, `TCSR5.PCK_EN = 1`, `TCSR5.PRESCALE = 0`.

Step4: If PWM5 is used, set `TCSR5.PWM_EN = 1`, in the same condition of above.

Step 5: stop the pclk as counter clock by, set `TCSR5.PCK_EN = 0`.

Step 6: set clock divider parameter `TCSR.PRESCALE`.

Step 7: enable the selected clock by set one of `TCSR.RTC_EN`, `TCSR.EXT_EN` or `TCSR.PCK_EN` to 1.

Step 8: start counter by write 1 to `TESR.TCST5` and enable the corresponding interrupt if needed.

Step 9: after counter matching interrupt, please do.

- Stop counter by write 1 to `TESR.TCCL5`.
- Disable the selected counter clock by clear the `TCSR.RTC_EN`, `TCSR.EXT_EN` or `TCSR.PCK_EN`.
- Disable more interrupt by change TDFR or TDHR to make them not equal to TCNT.
- Clear interrupt flag.

NOTE: In TCU5, in any case, if TDFR or TDHR is equal to TCNT, the interrupt flag will be set.

9 Watchdog Timer

9.1 Overview

The watchdog timer is used to resume the controller operation whenever it is disturbed by malfunctions such as noise and system errors. The watchdog timer can generate the reset signal.

Features:

- Generates WDT reset
- A 16-bit Data register and a 16-bit counter
- Counter clock uses the input clock selected by software
 - PCLK, EXTAL and RTCCLK can be used as the clock for counter
 - The division ratio of the clock can be set to 1, 4, 16, 64, 256 and 1024 by software

9.2 Register Description

In this section, we will describe the registers in WDT. Following table lists all the registers definition. All WDT register's 32bit address is physical address. And detailed function of each register will be described below.

Name	Description	RW	Reset Value	Address	Access Size
TDR	Watchdog Timer Data Register	RW	0x????	0x10002000	16
TCER	Watchdog Counter Enable Register	RW	0x00	0x10002004	8
TCNT	Watchdog Timer Counter	RW	0x????	0x10002008	16
TCSR	Watchdog Timer Control Register	RW	0x0000	0x1000200C	16

9.2.1 Watchdog Control Register (TCSR)

The TCSR is a 16-bit read/write register. It contains the control bits for WDT. It is initialized to 0x00 by any reset.

Bits	Name	Description	RW																																
15:6	Reserved	These bits always read 0, and written are ignored.	R																																
5:3	PRESCALE	These bits select the TCNT count clock frequency.	RW																																
		<table border="1"> <thead> <tr> <th>Bit 2</th> <th>Bit1</th> <th>Bit 0</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0</td> <td>Internal clock: CLK/1</td> </tr> <tr> <td>0</td> <td>0</td> <td>1</td> <td>Internal clock: CLK/4</td> </tr> <tr> <td>0</td> <td>1</td> <td>0</td> <td>Internal clock: CLK/16</td> </tr> <tr> <td>0</td> <td>1</td> <td>1</td> <td>Internal clock: CLK/64</td> </tr> <tr> <td>1</td> <td>0</td> <td>0</td> <td>Internal clock: CLK/256</td> </tr> <tr> <td>1</td> <td>0</td> <td>1</td> <td>Internal clock: CLK/1024</td> </tr> <tr> <td colspan="3">110~111</td> <td>Reserved</td> </tr> </tbody> </table>		Bit 2	Bit1	Bit 0	Description	0	0	0	Internal clock: CLK/1	0	0	1	Internal clock: CLK/4	0	1	0	Internal clock: CLK/16	0	1	1	Internal clock: CLK/64	1	0	0	Internal clock: CLK/256	1	0	1	Internal clock: CLK/1024	110~111			Reserved
		Bit 2		Bit1	Bit 0	Description																													
		0		0	0	Internal clock: CLK/1																													
		0		0	1	Internal clock: CLK/4																													
		0		1	0	Internal clock: CLK/16																													
		0		1	1	Internal clock: CLK/64																													
1	0	0	Internal clock: CLK/256																																
1	0	1	Internal clock: CLK/1024																																
110~111			Reserved																																
2	EXT_EN	Select EXTAL as the timer clock input. 1: Enable 0: Disable	RW																																
1	RTC_EN	Select RTCCLK as the timer clock input. 1: Enable 0: Disable	RW																																

0	PCK_EN	Select PCLK as the timer clock input. 1: Enable 0: Disable	RW
---	--------	--	----

NOTE: The input clock of timer and the PCLK should keep to the rules as follows:

Input clock of timer: IN_CLK	Clock generated from the frequency divider (PRESCALE): DIV_CLK
PCK_EN == 0, RTC_EN == 1 and EXT_EN == 0 (IN_CLK = RTCCLK)	$f_{DIV_CLK} < \frac{1}{2} f_{PCLK}$
PCK_EN == 0, RTC_EN == 0 and EXT_EN == 1 (IN_CLK = EXTAL)	$f_{DIV_CLK} < \frac{1}{2} f_{PCLK}$
PCK_EN == 1, RTC_EN == 0 and EXT_EN == 0 (IN_CLK = PCLK)	ANY

9.2.2 Watchdog Enable Register (TCER)

The TCER is an 8-bit read/write register. It contains the counter enable control bits for watchdog. It is initialized to 0x00 by any reset.

Bits	Name	Description	RW
7:1	Reserved	These bits always read 0, and written are ignored.	R
0	TCEN	Counter enable control. 0: Timer stop 1: Timer running	RW

9.2.3 Watchdog Timer Data Register (TDR)

The watchdog timer data register TDR is used to store the data to be compared with the content of the watchdog timer up-counter TCNT. This register can be directly read and written. (Default: indeterminate)

9.2.4 Watchdog Timer Counter (TCNT)

The watchdog timer counter (TCNT) is a 16-bit read/write counter. The up-counter TCNT can be reset to 0 by software and counts up using the prescaler output clock. When TCNT count up to equal to TDR, the comparison match signal will be generated and a WDT reset is generated. The data can be read out at any time. The counter data can be written at any time. (Default: indeterminate)

9.3 Watchdog Timer Function

The following describes steps of using WDT:

- 1 Setting the PRESCALE of input clock in register TCSR.
- 2 Set register TDR and TCNT.
- 3 Select the input clock and enable the input clock in register TCSR.

After initialize the register of timer, we should start the counter as follows:

- 4 Set TCEN bit in TCER to 1. The counter TCNT begins to count.
- 5 If TCNT = TDR, a WDT reset will be generated.

NOTES:

- 1 The input clock and PCLK should follow the rules advanced before.
- 2 The clock of WDT can be stopped by setting register TSR, and register TSR can only be set by register TSSR or TSCR. The content of register TSR, TSSR and TSCR can be found in TCU spec.

10 LCD Controller

10.1 Overview

The JZ integrated LCD controller has the capabilities to driving the latest industry standard STN and TFT LCD panels. It also supports some special TFT panels used in consuming electronic products. The controller performs the basic memory based frame buffer and palette buffer to LCD panel data transfer through use of a dedicated DMA controller. Temporal dithering (frame rate modulation) is supported for STN LCD panels.

Features:

- Basic Features
 - Support ITU601/656 data format
 - Single and Dual panel displays in STN mode
 - Single panel displays in TFT mode
 - Display size up to 800x600
 - Internal palette RAM 256x16 bits
- Colors Supports
 - Encoded pixel data of 1, 2, 4, 8 or 16 BPP in STN mode
 - Support 2, 4, 16 grayscales and up to 4096 colors in STN mode
 - Encoded pixel data of 1, 2, 4, 8, 16, 18 or 24 BPP in TFT mode
 - Support 65,536(65K), 262,144(260K) and up to 16,777,216 (16M) colors in TFT mode
- Panel Supports
 - Support 1, 2, 4, 8 data output pins in STN mode
 - Support 8-bit serial data output for 1bpp, 2bpp, 4bpp, 8bpp, 16bpp, 18bpp and 24bpp in TFT mode
 - Support 16-bit parallel data output for 1bpp, 2bpp, 4bpp, 8bpp and 16bpp in TFT mode
 - Support 18-bit parallel data output for 1bpp, 2bpp, 4bpp, 8bpp, 16bpp, 18bpp and 24bpp in TFT mode

10.2 Pin Description

Table 10-1 LCD Controller Pins Description

Name	I/O	Description
Lcd_pclk	Input/Output	Display device pixel clock
Lcd_vsync	Input/Output	Display device vertical synchronize pulse
Lcd_hsync	Input/Output	Display device horizontal synchronize pulse
Lcd_de	Output	Display device is STN: AC BIAS Pin Display device is NOT STN: data enable Pin
Lcd_d[17:0]	Output	Display device data pins
Lcd_spl* ¹	Output	Programmable special pin for generating control signals
Lcd_cls* ¹	Output	Programmable special pin for generating control signals
Lcd_ps* ¹	Output	Programmable special pin for generating control signals
Lcd_rev* ¹	Output	Programmable special pin for generating control signals

NOTE: The mode and timing of special pin Lcd_spl, Lcd_cls, Lcd_ps and Lcd_rev can be seen in **part 1.7 LCD Controller Pin Mapping.**

10.3 Block Diagram

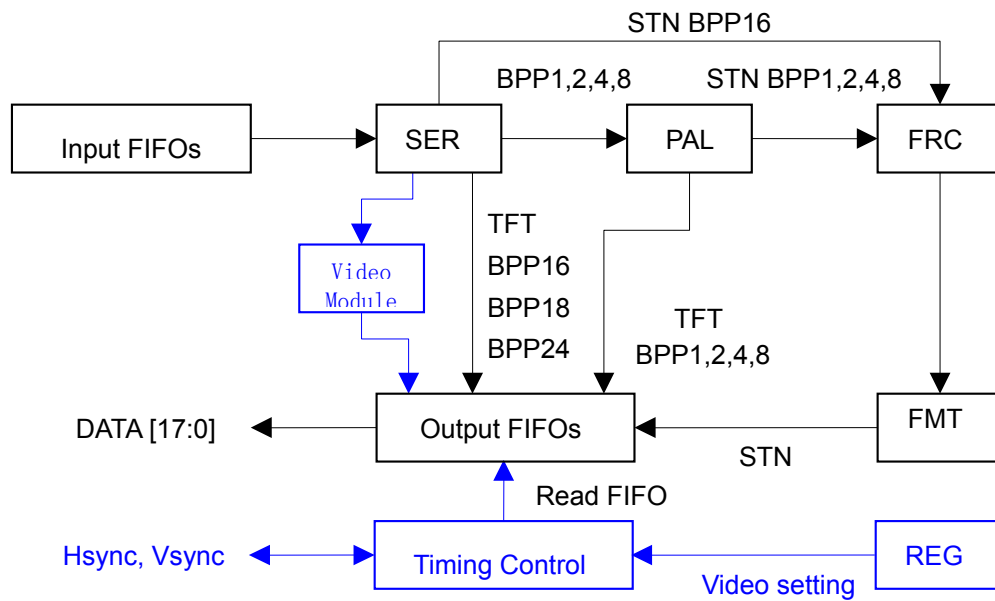

Figure 10-1 Block Diagram

10.4 LCD Display Timing

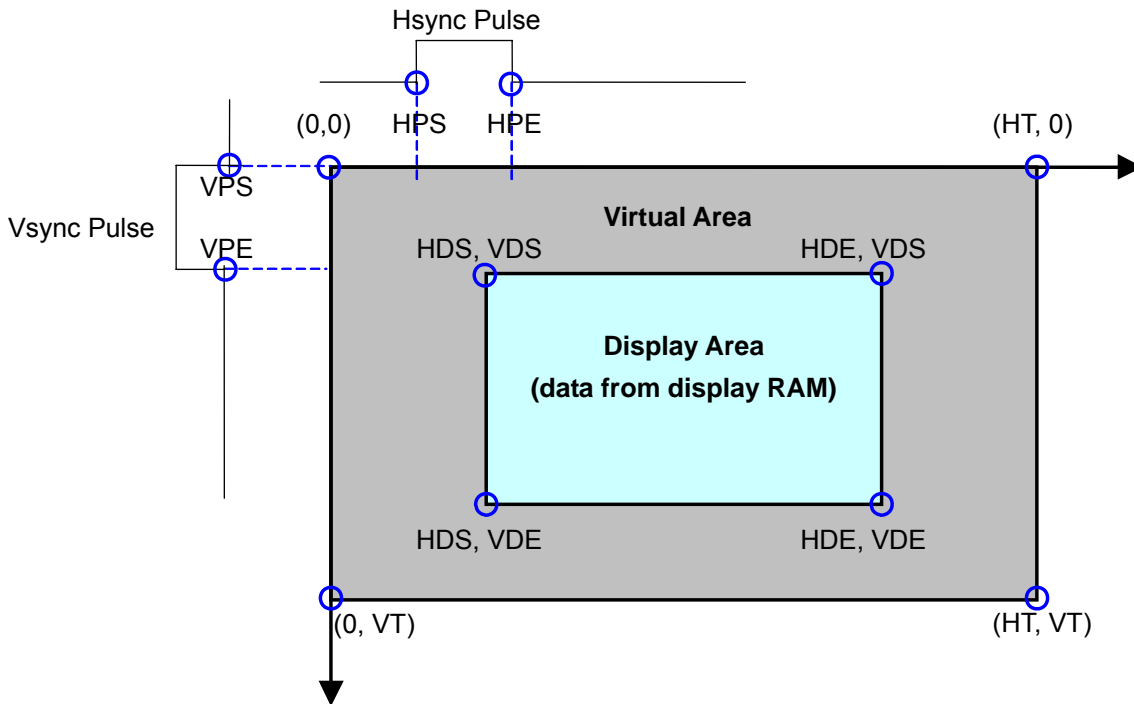

Figure 10-2 Display Parameters

NOTES:

- 1 VPS === 0
VSYNC pulse always start at point (0,0)
- 2 H: Horizontal V: Vertical T: Total
D: Display Area P: Pulse
S: Start point E: End point

In the (H, V) Coordinates:

- 1 The gray rectangle (0, 0) to (HT, VT) is "Virtual Area".
- 2 The blue rectangle (HDS, VDS) to (HDE, VDE) is "Display Area".
- 3 VPS, VPE defines the VSYNC signal timing. (VPS always be zero)
- 4 HPS, HPE defines the HSYNC signal timing.

All timing parameters start with "H" is measured in lcd_pclk ticks.

All timing parameters start with "V" is measured in lcd_hsync ticks.

This diagram describes the general LCD panel parameters, these can be set via the registers that describes in next section.

10.5 TV Encoder Timing

Some of Video Encoders for TV (Tele Vision) require interlaced timing interface.

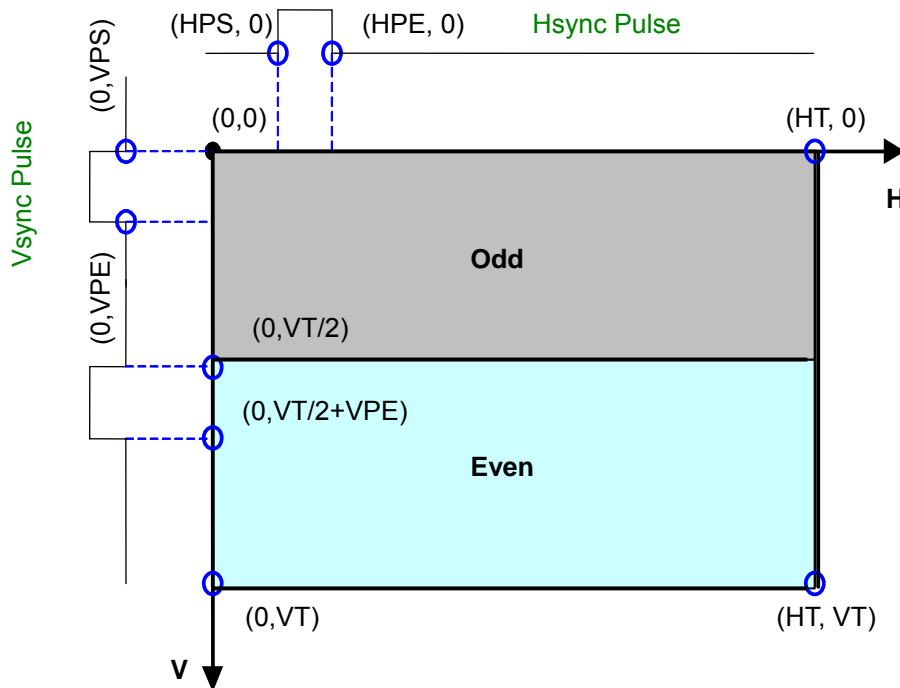

Figure 10-3 TV-Encoder Display Parameters

NOTES:

- 1 Even Field contains one more blank line.
e.g. For standard PAL timing, Odd field has 312 lines while even field has 313 lines.
- 2 Interlace mode generate 2 vsync pulse for each field. The second vsync start at $(VT/2)$, end at $(VT/2 + VPE)$.
- 3 Display Area & Virtual Area has the same size. $VDS=HDS=0$, $VDE=VT$, $HDE=HT$.

10.6 Register Description

Table 10-2 LCD Controller Registers Description

Name	RW	Reset Value	Address	Access Size
LCDCFG	RW	0x00000000	0x13050000	32
LCDVSYNC	RW	0x00000000	0x13050004	32

LCDCMD1 ^{*2}	R	0x00000000	0x1305005C	32

NOTES:

- 1 ^{*1}: These registers are only used for SPECIAL TFT panels.
- 2 ^{*2}: These registers are only used for Dual Panel STN panels.

10.6.1 Configure Register (LCDCFG)

Bits	Name	Description	RW						
31	LCDPIN*1	LCD PIN Select bit. These two bits are used to choose the function of LCD PINS or SLCD PINS. The function of pins is as follows: <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 5px;"> <tr> <th style="width: 50%;">LCDPIN</th> <th style="width: 50%;">PIN SELECT</th> </tr> <tr> <td>0</td> <td>LCD PIN</td> </tr> <tr> <td>1</td> <td>SLCD PIN</td> </tr> </table>	LCDPIN	PIN SELECT	0	LCD PIN	1	SLCD PIN	RW
LCDPIN	PIN SELECT								
0	LCD PIN								
1	SLCD PIN								
30:24	Reserved	These bits always read 0, and written are ignored.	R						
23	PSM	PS signal mode bit. 1: disabled; 0: enabled.	RW						
22	CLSM	CLS signal mode bit. 1: disabled; 0: enabled.	RW						
21	SPLM	SPL signal mode bit. 1: disabled; 0: enabled.	RW						
20	REVM	REV signal mode bit. 1: disabled; 0: enabled.	RW						
19	HSYNM	H-Sync signal polarity choice function. 1: disabled; 0: enabled.	RW						
18	PCLKM	Dot clock signal polarity choice function. 1: disabled; 0: enabled.	RW						
17	INVDAT	Inverse output data. 0: normal; 1: inverse.	RW						
16	SYNDIR	V-Sync and H-Sync direction. 0: output; 1:input.	RW						
15	PSP	PS pin reset state.	RW						
14	CLSP	CLS pin reset state.	RW						
13	SPLP	SPL pin reset state.	RW						
12	REVP	REV pin reset state.	RW						
11	HSP	H-Sync polarity. 0: active high; 1: active low.	RW						
10	PCP	Pix-clock polarity. 0: data translations at rising edge 1: data translations at falling edge	RW						
9	DEP	Data Enable polarity. 0: active high; 1: active low.	RW						
8	VSP	V-Sync polarity. 0: leading edge is rising edge 1: leading edge is falling edge	RW						
7	18/16	18-bit TFT Panel or 16-bit TFT Panel. This bit will be available when MODE [3:2] is equal to 0. 0: 16-bit TFT Panel 1: 18-bit TFT Panel	RW						
6	Reserved	These bits always read 0, and written are ignored.	R

1	IFU1	In FIFO 1 under run.	RW
0	LDD	LCD disable. 0: not been normal disabled; 1: been normal disabled.	RW

10.6.13 Interrupt ID Register (LCDIID)

LCDIID is a read-only register that contains a copy of the Frame ID register (LCDFID) from the descriptor currently being processed when a start of frame (SOF) or end of frame (EOF) interrupt is generated. LCDIID is written to only when an unmasked interrupt of the above type is signaled and there are no other unmasked interrupts in the LCD controller pending. As such, the register is considered to be sticky and will be overwritten only when the signaled interrupt is cleared by writing the LCD controller status register. For dual-panel displays, LCDIID is written only when both channels have reached a given state.

LCDIID is written with the last channel to reach that state. (i.e. LCDFID of the last channel to reach SOF would be written in LCDIID if SOF interrupts are enabled). Reserved bits must be written with zeros and reads from them must be ignored.

Bits	Name	Description	RW
31:0	IID	A copy of Frame ID register, which transferred from Descriptor.	RW

10.6.14 Descriptor Address Register0, 1 (LCDDA0, 1)

A frame descriptor is a 4-word block, aligned on 4-word (16-byte) boundary, in external memory:

WORD [0] contains the physical address for next LCDDAx.

WORD [1] contains the physical address for LCDSAx.

WORD [2] contains the value for LCDFIDx.

WORD [3] contains the value for LCDCMDx.

Software must write the physical address of the first descriptor to LCDDAx before enabling the LCD Controller. Once the LCD Controller is enabled, the first descriptor is read, and all 4 registers are written by the DMAC. The next frame descriptor pointed to by LCDDAx is loaded into the registers for the associated DMA channel after all data for the current descriptor has been transferred.

NOTE: If only one frame buffer is used in external memory, the LCDDAx field (word [0] of the frame descriptor) must point back to itself. That is to say, the value of LCDDAx is the physical address of itself.

Read/write registers LCDDA0 and LCDDA1, corresponding to DMA channels 0 and 1, contain the physical address of the next descriptor in external memory. The DMAC fetches the descriptor at this location after finishing the current descriptor. On reset, the bits in this register are zero. The target address must be aligned to 16-byte boundary. Bits [3:0] of the address must be zero.

Bits	Name	Description	RW
31:0	DA0, 1	Next descriptor physical address. And descriptor structure as following: WORD [0]: next descriptor physical address WORD [1]: the buffer physical address WORD [2]: the buffer ID value (Only for debug) WORD [3]: the buffer property. The value is same as LCDCMD	RW

10.6.15 Source Address Register0, 1 (LCDSA0, 1)

Registers LCDSA0 and LCDSA1, corresponding to DMA channels 0 and 1, contain the **physical** address of frame buffer or palette buffer in external memory. The address must be aligned on a 4, 8, or 16 word boundary according to register LCDCTRL .BST. If this descriptor is for palette data, LCDSA0 points to the memory location of the palette buffer. If this descriptor is for frame data, LCDSAx points to the memory location of the frame buffer. This address is incremented by hardware as the DMAC

fetches data from memory. If desired, the Frame ID Register can be used to hold the initial frame source address.

Bits	Name	Description	RW
31:0	SA0, 1	Buffer start address. (Only for driver debug)	R

10.6.16 Frame ID Register0 (LCDFID0,1)

Registers LCDFID0 and LCDFID1, corresponding to DMA channels 0 and 1, contain an ID field that describes the current frame. The particular use of this field is up to the software. This ID register is copied to the LCD Controller Interrupt ID Register when an interrupt occurs.

Bits	Name	Description	RW
31:0	FID0, 1	Frame ID. (Only for debug)	R

10.6.17 DMA Command Register0, 1 (LCDCMD0, 1)

Bits	Name	Description	RW
31	SOFINT	Enable start of frame interrupt. When SOFINT =1, the DMAC sets the start of frame bit	R

		(LCDSTATE.SOF) when starting a new frame. The SOF bit is set after a new descriptor is loaded from memory and before the palette/frame data is fetched. In dual-panel mode, LCDSTATE.SOF is set only when both channels reach the start of frame and both frame descriptors have SOFINT set. SOFINT must not be set for palette descriptors in dual-panel mode, since only one channel is ever used to load the palette descriptor.	
30	EOFINT	Enable end of frame interrupt. When EOFINT =1, the DMAC sets the end of frame bit (LCDSTATE.EOF) after fetching the last word in the frame buffer. In dual-panel mode, LCDSTATE.EOF is set only when both channels reach the end of frame and both frame descriptors have EOFINT set. EOFINT must not be set for palette descriptors in dual-panel mode, since only one channel is ever used to load the palette descriptor.	R
29	Reserved	These bits always read 0, and written are ignored.	R
28	PAL	The descriptor contains a palette buffer. PAL indicates that data being fetched will be loaded into the palette RAM. If PAL =1, the palette RAM data is loaded via DMA channel 0 as follows: In bpp1, 2, 4, 8 modes, software must load the palette at least once after enabling the LCD. In bpp16 mode, PAL must be 0.	R
27:24	Reserved	These bits always read 0, and written are ignored.	R
23:0	LEN	The buffer length value (in WORD). The LEN bit field determines the number of bytes of the buffer size pointed by LCDSAx. LEN = 0 is not valid. DMAC fetch data according to LEN. Each time one or more word(s) been fetched, LEN is decreased automatically. Software can read LEN.	R

10.7 LCD Controller Pin Mapping

There are several mapping schemes for different LCD panels.

10.7.1 TFT and CCIR656 Pin Mapping

10.8 Display Timing

10.8.1 General 16-bit and 18-bit TFT Timing

This section shows the general 16-bit and 18-bit TFT LCD timing diagram, the polarity of signal “Vsync”, “Hsync”, and “PCLK” can be programmed correspond to the LCD panel specification.

Figure 10-4 General 16-bit and 18-bit TFT LCD Timing

10.8.2 8-bit Serial TFT Timing

This section shows the 8-bit serial TFT LCD timing diagram, the polarity of signal “Vsync”, “Hsync”, and “PCLK” can be programmed correspond to the LCD panel specification.

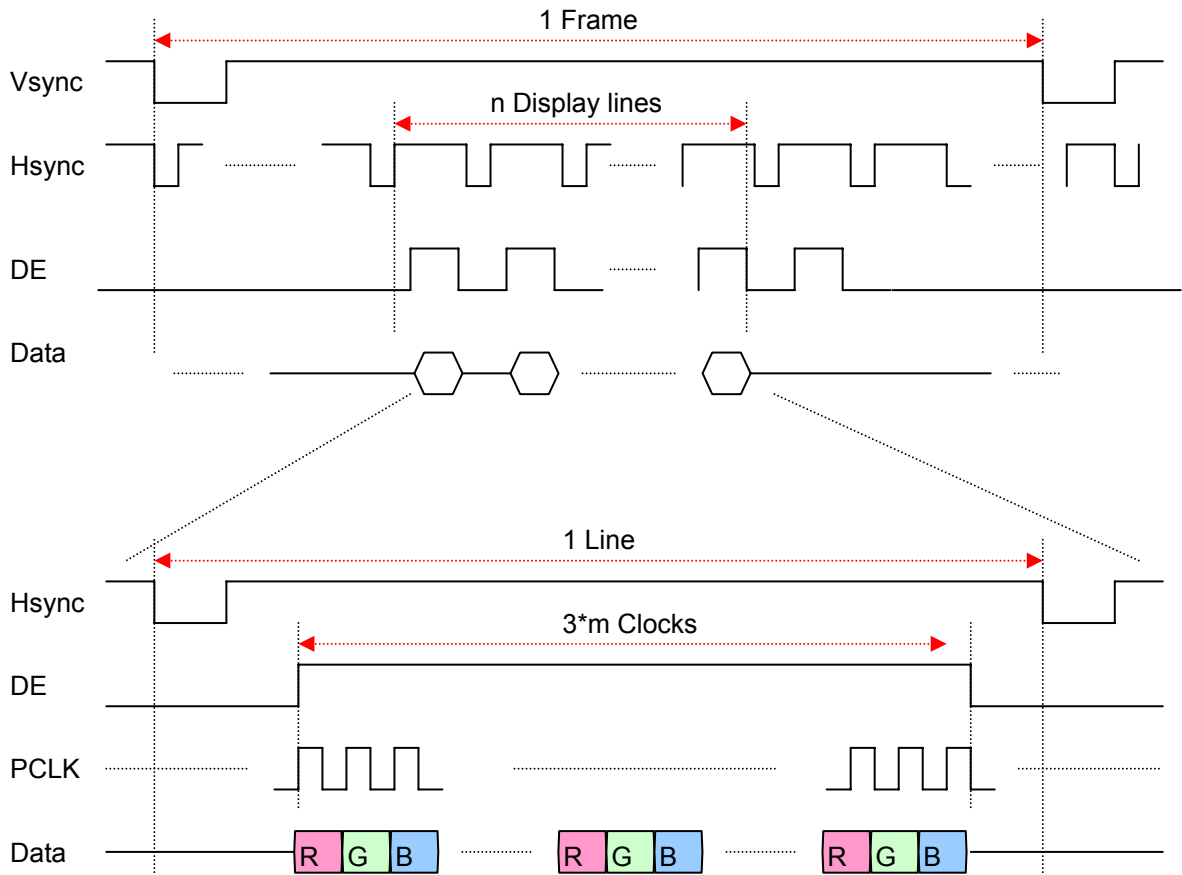

Figure 10-5 8-bit serial TFT LCD Timing (24bpp)

10.8.3 Special TFT Timing

Based on the general TFT LCD support, this controller also provides 4 special signals that can be programmed to general some special timing used for some panel. All 4 signals are worked in two modes: pulse mode and toggle mode. Signal “CLS” is fixed in pulse mode, and “REV” in toggle mode. The work mode of signals “SPL” and “PS” are defined in the special TFT LCD mode 1 to mode 3, either pulse mode or toggle mode. The position and polarity of these 4 signals can be programmed via registers. The Figures show the two modes as follows: (The toggle mode of signal “SPL” is different with the others signal. “SPL” does toggle after display line.)

Figure 10-6 Special TFT LCD Timing 1

Figure 10-7 Special TFT LCD Timing 2

These two Figures show the timing of pulse mode and toggle mode, the pulse mode timing is same and the toggle mode timing is different. Timing 1 shows the condition when the total lines in 1 frame is odd (the number of display is even and the number of blank is odd), so the phase of REV inverse at the first line of each frame and the phase of SPL dose not inverse at the first line of each frame. Timing 2 shows the condition when the total lines in 1 frame is even (the number of display is even and the number of blank is even), so the phase of REV and SPL dose not inverse at the first line of each frame.

When LCDC is enabled ,there will be a null line to be add before transferring data to LCD panel. So the toggle mode except SPL signal of special 3 TFT mode is when reset level is high,the first valid edge will be rising edge. SPL signal of special 3 TFT mode is when reset level is high,the first valid edge will be falling edge.

10.9 Format of Palette

This LCD controller contains a palette RAM with 256-entry x 16-bit used only for BPP8, BPP4, BPP2 and BPP1. Palette RAM data is loaded directly from the external memory palette buffer by DMAC channel 0. Each word of palette buffer contains 2 palette entries.

- In 8-bpp modes, palette buffer size is 128 words.
- In 4-bpp modes, palette buffer size is 8 words.
- In 2-bpp modes, palette buffer size is 2 words.
- In 1-bpp modes, palette buffer size is 1 word.
- In 16/18/24-bpp modes, has no palette buffer.

Palette buffer base address	Bit: 31 ... 16	Bit: 15 ... 0
Palette entry	Entry-1 bit: 15 ... 0	Entry-0 bit: 15 ... 0
Palette buffer base address + 4	Bit: 31 ... 16	Bit: 15 ... 0
Palette entry	Entry-3 bit: 15 ... 0	Entry-2 bit: 15 ... 0
Palette buffer base address + 8	Bit: 31 ... 16	Bit: 15 ... 0
Palette entry	Entry-5 bit: 15 ... 0	Entry-4 bit: 15 ... 0

10.9.1 STN

For STN Panel, 16-bpp pixel data is encoded with RGB 565 or RGB 555.

Please refer to register LCDCTRL.RGB.

BPP 16, RGB 565, pixel encoding for STN Panel:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R4	R3	R2	R1	R0	G5	G4	G3	G2	G1	G0	B4	B3	B2	B1	B0

BPP 16, RGB 555, pixel encoding for STN Panel:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	R4	R3	R2	R1	R0	G4	G3	G2	G1	G0	B4	B3	B2	B1	B0

10.9.2 TFT

BPP 16, RGB 565, pixel encoding for TFT Panel:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R4	R3	R2	R1	R0	G5	G4	G3	G2	G1	G0	B4	B3	B2	B1	B0

NOTE: For BPP 16, 18, 24, palette is bypass.

10.10 Format of Frame Buffer

10.10.1 16bpp

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R4	R3	R2	R1	R0	G5	G4	G3	G2	G1	G0	B4	B3	B2	B1	B0
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R4	R3	R2	R1	R0	G5	G4	G3	G2	G1	G0	B4	B3	B2	B1	B0

10.10.2 18bpp

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	R5	R4	R3	R2	R1	R0	0	0
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
G5	G4	G3	G2	G1	G0	0	0	B5	B4	B3	B2	B1	B0	0	0

10.10.3 24bpp

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	R7	R6	R5	R4	R3	R2	R1	R0
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
G7	G6	G5	G4	G3	G2	G1	G0	B7	B6	B5	B4	B3	B2	B1	B0

10.11 Format of Data Pin Utilization

10.11.1 Mono STN

In Mono STN mode, data pin pixel ordering of one LCD screen row. Column 0 is the first pixel of a screen row.

Upper panel								
Panel data width	Col0	Col1	Col2	Col3	Col4	Col5	Col6	Col7
1 bit	D0	D0	D0	D0	D0	D0	D0	D0
2 bit	D1	D0	D1	D0	D1	D0	D1	D0
4 bit	D3	D2	D1	D0	D3	D2	D1	D0
8 bit	D7	D6	D5	D4	D3	D2	D1	D0
Lower panel (dual-panel mode)								
4 bit	D11	D10	D9	D8	D11	D10	D9	D8
8 bit	D15	D14	D13	D12	D11	D10	D9	D8

10.11.2 Color STN

In Color STN mode, data pin pixel ordering of one LCD screen row. Column 0 is the first pixel of a screen row.

Upper panel							
Col0 (R)	Col0 (G)	Col0 (B)	Col1 (R)	Col1 (G)	Col1 (B)	Col2 (R)	Col2 (G)
D7	D6	D5	D4	D3	D2	D1	D0
Lower panel (dual-panel mode)							
D15	D14	D13	D12	D11	D10	D9	D8

10.11.3 18-bit Parallel TFT

Col0 (RGB)																	
D17	D16	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

10.11.4 16-bit Parallel TFT

Col0 (RGB)															
D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

10.11.5 8-bit Serial TFT (24bpp)

Col0 (R)							
D7	D6	D5	D4	D3	D2	D1	D0
Col0 (G)							
D7	D6	D5	D4	D3	D2	D1	D0
Col0 (B)							
D7	D6	D5	D4	D3	D2	D1	D0

10.12 LCD Controller Operation

10.12.1 Set LCD Controller Device Clock and Pixel Clock

The LCD Controller has 2 clock input: device clock and pixel clock. The both clocks are generated by CPM (Clock and Power Manager). The frequency of the 2 clocks can be set by CPM registers. CPM registers CPCCR.LDIV and CPCCR.PCS set LCD device clock division ratio, and LPCDR set LCD pixel clock division ratio. Please refer to CPM spec for detail.

LCD device clock is the LCD controller's internal clock while LCD pixel clock is output to drive LCD panel. There have 2 rules for LCD clocks:

- 1 For TFT Panel, the frequency of LCD device clock must be at least 1.5 times of LCD pixel clock.
- 2 For STN Panel, the frequency of LCD device clock must be at least 3 times of LCD pixel clock.

LCD panel determines the frequency of LCD pixel clock.

10.12.2 Enabling the Controller

If the LCD controller is being enabled for the first time after system reset or sleep reset, all of the LCD registers must be programmed as follows:

- 1 Write the frame descriptors and, if needed, the palette descriptor to memory.
- 2 Program the entire LCD configuration registers except the Frame Descriptor Address Registers (LCDDAx) and the LCD Controller enable bit (LCDCTRL.ENA).
- 3 Program LCDDAx with the memory address of the palette/frame descriptor.
- 4 Enable the LCD controller by writing to LCDCTRL.ENA.

If the LCD controller is being re-enabled, there has not been a reset since the last programming; only the registers LCDDAx and LCDCTRL.ENA need to be reprogrammed. The LCD Controller Status Register (LCDSTATE) must also be written to clear any old status flags before re-enabling the LCD controller.

Once the LCD controller has been enabled, do not write new values to LCD registers except LCDCTRL.ENA or DIS or LCDDA0/1.

10.12.3 Disabling the Controller

The LCD controller can be disabled in two ways: regular and quick.

- 1 Regular disabling.
Regular disabling is accomplished by setting the disable bit, LCDCTRL.DIS. The other bits in LCDCTRL must not be changed — read the register, set the DIS bit, and rewrite the register. This method causes the LCD controller to stop cleanly at the end of a frame. The LCD Disable Done bit, LCDSTATE.LDD, is set when the LCD controller finishes displaying the last

frame, and the enable bit, LCDCTRL.ENA, is cleared automatically by hardware. LCDCTRL.DIS must be set zero when enabling the controller.

2 Quick disabling.

Quick disabling is accomplished by clearing the enable bit, LCDCTRL.ENA. The LCD controller will finish any current DMA transfer, stop driving the panel, setting the LCD Quick Disable bit (LCDSTATE.QD) and shut down immediately. This method is intended for situations such as a battery fault, where system bus traffic has to be minimized immediately so the processor can have enough time to store critical data to memory before the loss of power. The LCD controller must not be re-enabled until the QD bit is set, indicating that the quick shutdown is complete. Do not set the DIS bit when a quick disabling command has been issued.

NOTE: It is strongly recommended that software set the “LCD Module Stop Bit” in PMC to shut down LCDC clock supply to save power consumption after disable LCDC. Please refer to PMC for detailed information.

10.12.4 Resetting the Controller

At reset, the LCD Controller is disabled. All LCD Controller Registers are reset to the conditions shown in the register descriptions.

10.12.5 Frame Buffer & Palette Buffer

The starting address of frame buffer stored in external memory must be aligned to 4, 8 or 16 words boundary according to register LCDCTRL.BST. The length of buffer must be multiple of word (32-bit).

If LCDCTRL .BST = 0, align frame and palette buffer to 16 word boundary

If LCDCTRL .BST = 1, align frame and palette buffer to 8 word boundary

If LCDCTRL .BST = 2, align frame and palette buffer to 4 word boundary

One frame buffer contains encoded pixel data of multiple of screen lines; each line of encoded pixel data must be aligned to word boundary. If the length of a line is not the multiple of word, extra bits must be applied to reach a word boundary. It is suggested that the extra bits to be set zero.

11 Smart LCD Controller

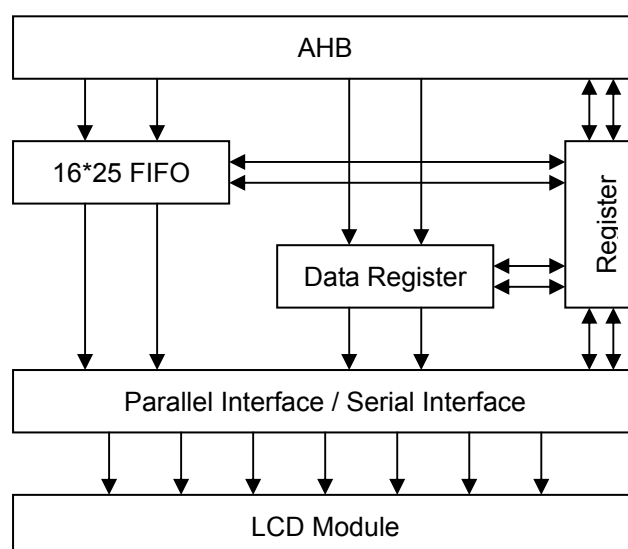

11.1 Overview

The Smart LCD Controller transfers data from the display buffer to the LCD Module. It supports DMA operation and register operation.

Features:

- Supports a large variety of LCD Module from different vendors
- Supports parallel and serial interfaces
- Supports different size of display panel
- Supports different width of pixel data
- Supports DMA operation and register operation
- Supports Write Operation. Read Operation is not supported

11.2 Structure

11.3 Pin Description

Table 11-1 SLCD Pins Description

Name	I/O	Description	Interface
SLCD_RS	O	Command/Data Select Signal. The polarity of the signal can be programmable.	Serial: RS Parallel: RS
SLCD_CS	O	Chip Select Signal. The polarity of the signal can be programmable.	Serial: CS Parallel: Sample Data with the edge of CS
SLCD_CLK	O	The clock of SLCD. The polarity of the clock can be programmable.	Serial or not used
SLCD_DAT ^{*1} [17:0]	O	The data of SLCD.	Serial: SLCD_DAT [15] Parallel: SLCD_DAT [17:0] SLCD_DAT [15:0] SLCD_DAT [7:0]

NOTE:

*1: SLCD_DAT [15] is also use as data pin for serial. The SLCD pins are shared with LCDC. You can see the set of register LCDCFG.LCDPIN in LCDC spec.

11.4 Register Description

In this section, we will describe the registers in Smart LCD controller. Following table lists all the registers definition. All register's 32bit address is physical address. And detailed function of each register will be described below.

Name	Description	RW	Reset Value	Address	Access Size
MCFG	SLCD Configure Register	RW	0x0000	0x130500A0	32
MCTRL	SLCD Control Register	RW	0x00	0x130500A4	8
MSTATE	SLCD Status Register	RW	0x00	0x130500A8	8
MDATA	SLCD Data Register	RW	0x00000000	0x130500AC	32
MFIFO	SLCD FIFO	RW	0x00000000	0x130500B0	32

11.4.1 SLCD Configure Register (MCFG)

The register MCFG is used to configure SLCD.

Bits	Name	Description	RW										
15:14	TRIGGER	FIFO trigger for DMA Operation. Trigger Length Selection. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>TRIGGER</th> <th>Trigger Length</th> </tr> </thead> <tbody> <tr> <td>00</td> <td>4 word</td> </tr> <tr> <td>01</td> <td>8 word</td> </tr> <tr> <td>10</td> <td>Reserved</td> </tr> <tr> <td>11</td> <td>Reserved</td> </tr> </tbody> </table>	TRIGGER	Trigger Length	00	4 word	01	8 word	10	Reserved	11	Reserved	RW
TRIGGER	Trigger Length												
00	4 word												
01	8 word												
10	Reserved												
11	Reserved												
13	Reserved	These bits always read 0, and written are ignored.	R										

12:10	DWIDTH ^{*1}	Data Width.		RW
		DWIDTH	Data Width	
		000	18-bit once Parallel/Serial	
		001	16-bit once Parallel/Serial	
		010	8-bit third time Parallel	
		011	8-bit twice Parallel	
		100	8-bit once Parallel/Serial	
		111	9-bit twice Parallel	
101~110	Reserved			
9:7	CWIDTH ^{*1}	Command Width.		RW
		CWIDTH	Command Width	
		00	16-bit once	
		01	8-bit once	
		10	18-bit once	
11	Reserved			
7:5	Reserved	These bits always read 0, and written are ignored.		R
4	CSPLY	CS Polarity. (CS initial level will be different from CS Polarity) 0: Active Level is Low 1: Active Level is High		RW
3	RSPLY	RS Polarity. 0: Command RS = 0, Data RS = 1 1: Command RS = 1, Data RS = 0		RW
2	Reserved	These bits always read 0, and written are ignored.		R
1	CLKPLY	LCD_CLK Polarity. 0: Active edge is Falling 1: Active edge is Rising		RW
0	TTYPE	Transfer Type. 0: Parallel 1: Serial		RW

NOTE:

^{*1}: The set of DWIDTH and CWIDTH should keep to the rules as follows:

Interface Mode	Command Width	Data Width	Color
Parallel	18-bit	18-bit once	
	16-bit	16-bit once	
		9-bit twice	
		8-bit	8-bit once
	8-bit	8-bit twice	
8-bit third times			
Serial	18-bit	18-bit once	
	16-bit	16-bit once	

	8-bit	8-bit once	
		8-bit twice	
		8-bit third times	

11.4.2 SLCD Control Register (MCTRL)

MCTRL is SLCD Control Register.

Bits	Name	Description	RW
7:1	Reserved	These bits always read 0, and written are ignored.	R
0	DMATXEN	SLCD DMA Transfer Enable. This bit is only used for DMA automatic transfer. <ul style="list-style-type: none"> 1 This bit starts the automatic transfer of image data from system memory to LCDM. 2 When DMAC finishes transferring the data, and the MSTATE.BUSY bit is 0, you can clear DMATXEN bit to stop DMA mode. 	RW

11.4.3 SLCD Status Register (MSTATE)

The register of MSTATE is SLCD status register.

Bits	Name	Description	RW
7:1	Reserved	These bits always read 0, and written are ignored.	R
0	BUSY	Transfer is working or not. This bit will be set to 1 when transfer is working. It will be cleared by hardware when transfer is finished.	RW

		0: not busy 1: busy	
--	--	------------------------	--

11.4.4 SLCD Data Register (MDATA)

The register MDATA is used to send command or data to LCM. When RS=0, the low 24-bit is used as command. When RS=1, the low 24-bit is used as data.

Bits	Name	Description	RW
31	RS	The RS bit of data register is used to decide the meanings of the low 24-bit. 0: data 1: command	RW
30:24	Reserved	These bits always read 0, and written are ignored.	R
23:0	DATA/CMD	Data or Command Register.	RW

11.4.5 SLCD FIFO (MFIFO)

The FIFO is used to send command or data to LCM. When RS=0, the low 24-bit is used as command. When RS=1, the low 24-bit is used as data.

Bits	Name	Description	RW
31	RS	The RS bit of FIFO is used to decide the meanings of the low 24-bit. 0: data 1: command	RW
30:24	Reserved	These bits always read 0, and written are ignored.	R
23:0	DATA/CMD	Data or Command Register.	RW

11.5 System Memory Format

The format of Command and Data in system memory is as follows:

11.5.1 Data format

1 24-bit color

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	X	X	X	X	X	X	X	R7	R6	R5	R4	R3	R2	R1	R0
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
G7	G6	G5	G4	G3	G2	G1	G0	B7	B6	B5	B4	B3	B2	B1	B0

2 18-bit color

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	X	X	X	X	X	X	X	R5	R4	R3	R2	R1	R0	X	X
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
G5	G4	G3	G2	G1	G0	X	X	B5	B4	B3	B2	B1	B0	X	X

3 16-bit color

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R4	R3	R2	R1	R0	G5	G4	G3	G2	G1	G0	B4	B3	B2	B1	B0

4 8-bit color

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
X	X	X	X	X	X	X	X	C7	C6	C5	C4	C3	C2	C1	C0

11.5.2 Command Format

1 18-bit command

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
1	X	X	X	X	X	X	X	X	X	X	X	X	X	C17	C16
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C15	C14	C13	C12	C11	C10	C9	C8	C7	C6	C5	C4	C3	C2	C1	C0

2 16-bit command

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
1	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C15	C14	C13	C12	C11	C10	C9	C8	C7	C6	C5	C4	C3	C2	C1	C0

3 8-bit command once

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
1	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
X	X	X	X	X	X	X	X	C7	C6	C5	C4	C3	C2	C1	C0

4 8-bit command twice (Command = command part + data part, twice transfer)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
1	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
X	X	X	X	X	X	X	X	C7	C6	C5	C4	C3	C2	C1	C0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
1	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
X	X	X	X	X	X	X	X	D7	D6	D5	D4	D3	D2	D1	D0

NOTE: The command is made up of command part and data part, but need twice transfer, and the first transfer is command part and the second transfer is data part. You need to divide the command into two parts by software.

11.6 Transfer Mode

Two transfer modes can be used: DMA Transfer Mode and Data Register Transfer Mode.

11.6.1 DMA Transfer Mode

Command and data can be recognized by RS bit coming from memory. The format of DMA transfer can be as follows:

- 1 Command and Data

- 2 Only Data

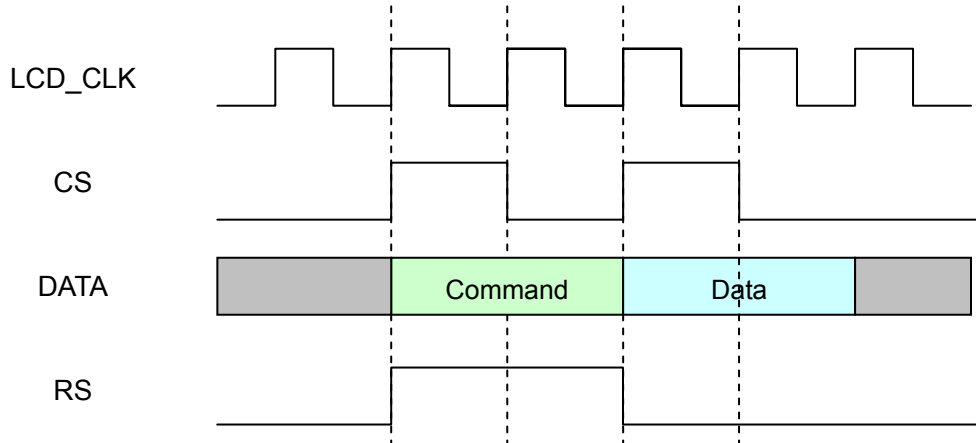

11.6.2 Register Transfer Mode

Each time you can write a command or a data to the register, then it will transfer the RS signal and data or command to LCM. Command and data can be recognized by RS bit coming from data register. The format of data register transfer can be as follows:

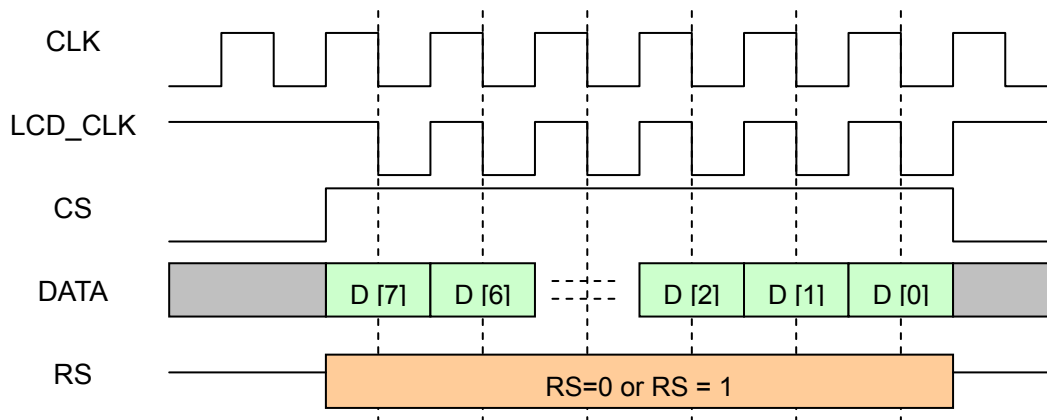

11.7 Timing

11.7.1 Parallel Timing

11.7.2 Serial Timing

11.8 Operation Guide

11.8.1 DMA Operation

1 Start DMA transfer.

- a Initial DMAC.
- b Set MCFG to configure SLCD.
- c Before starting DMA, Wait for MSTATE.BUSY == 0.
- d Set MCTRL.DMATXEN to 1 to start DMA transfer. (If you don't want to stop DMA transfer, you need not to check MSTATE.BUSY.)

2 Stop DMA transfer.

- a Check the status of DMAC, and stop DMAC.
- b Wait MSTATE.BUSY == 0.
- c Set MCTRL.DMATXEN to 0 to stop DMA transfer.

3 Restart DMA transfer.

When MCTRL.DMATXEN is set to 0, and then you want to restart DMA transfer at once, you should ensure that MCTRL.DMATXEN must keep low level at least three cycles of PIXCLK.

11.8.2 Register Operation

- 1 Set MCFG to configure SLCD.
- 2 Wait for MSTATE.BUSY == 0.
- 3 Set MDATA register.
- 4 Wait for MSTATE.BUSY == 0.
- 5 Set MDATA register.
- 6 Wait for MSTATE.BUSY == 0.
- 7

12 Image Process Unit

12.1 Overview

IPU (Image process unit) contains Resize and CSC (color space conversion), which is used for image post processing.

12.2 Features

- Input data
 - from external memory
- Input format
 - YUV /YCbCr (4:2:0, 4:2:2, 4:4:4, 4:1:1)
- Output format
 - RGB (565, 555, 888)
- Minimum input image size
 - 33x33
- Maximum input image size
 - 2047x2047
- Image resizing
 - Up scaling ratios up to 1:2 in fractional steps
 - Down scaling ratios up to 20:1 in fractional steps

12.3 Block Diagram

12.4 Data flow

12.4.1 Input Data

Y, U, V (or Y, Cb, Cr; following chapters use YUV for convenience) data would be load from external memory by DMA respectively.

12.4.2 Output Data

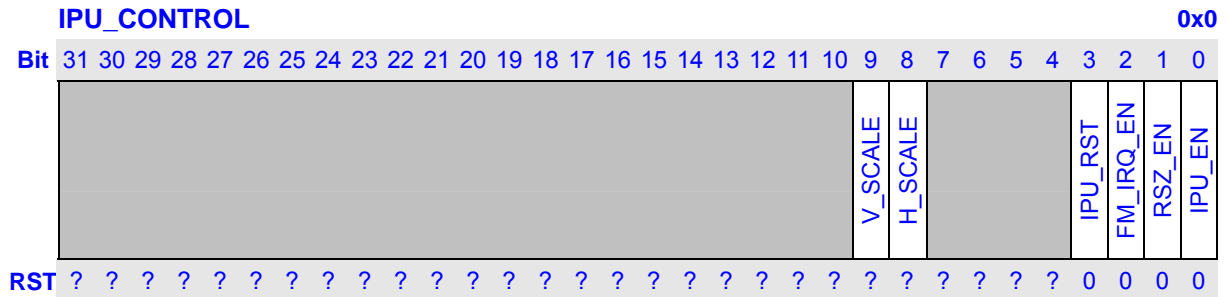

The data format after CSC is RGB (565, 555, 888), and the data would be stored back to the external memory by DMA.

12.4.3 Resize Coefficients LUT

The resize coefficients look up tables are preset by software according to specific format (see later chapter for detail). There are 2 tables support independent horizontal and vertical scaling. Each table has 20 entries that can accommodate up to 20 coefficients.

12.5 Register definition

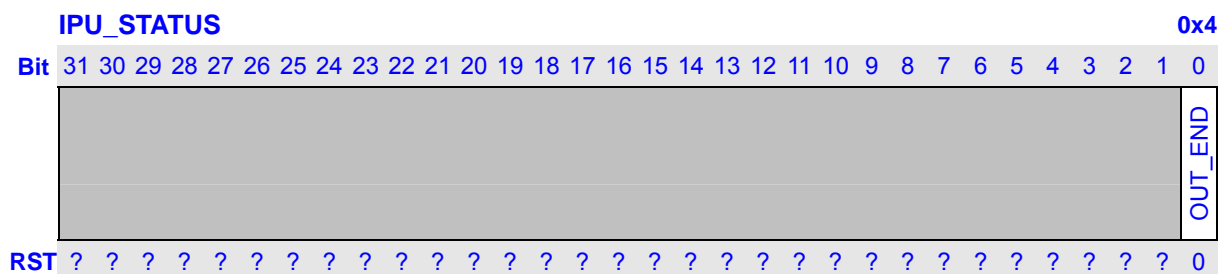

12.5.1 IPU Control Register

Bits	Name	Description	R/W
31:10	Reserved	Writing has no effect, read as zero.	R
9	V_SCALE	Vertical direction scale flag. 0: down scaling; 1: up scaling.	RW
8	H_SCALE	Horizontal direction scale flag. 0: down scaling; 1: up scaling.	RW
7:4	Reserved	Writing has no effect, read as zero.	R
3	IPU_RST	Reset IPU. Writing 1: reset IPU; 0: no effect. Read as zero.	W
2	FM_IRQ_EN	Frame process finish interrupt enable. 1: enable; 0: disable.	RW
1	RSZ_EN	Resize enable. 1: enable; 0: disable.	RW
0	IPU_EN	IPU enable. 1: enable; 0: disable. Once IPU is enabled, IPU keeps working until the flag OUT_END in the status register IPU_STATUS is set value 1.	RW

NOTE: Setting value 1 to IPU_RST will reset all software visible IPU registers immediately. It is not recommended that stopping IPU abruptly by clearing IPU_EN when IPU is running (IPU_EN=1, OUT_END=0), or writing value 1 to IPU_RST when DMA (in or out) is working (IPU_EN=1, OUT_END=0), otherwise, the result is unpredictable.

12.5.2 IPU Status Register

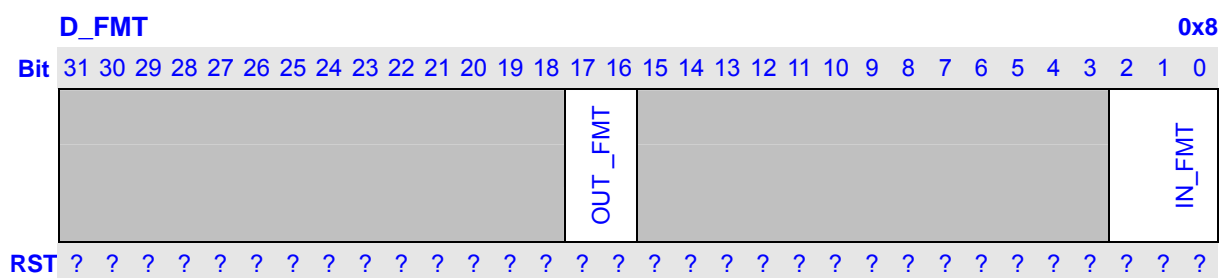

Bits	Name	Description	R/W
31:1	Reserved	Writing has no effect, read as zero.	R

0	OUT_END	Output DMA termination flag. 1: finished; 0: not finished HW can only set 1 to it, while SW can only clear it to 0.	R/W
---	---------	--	-----

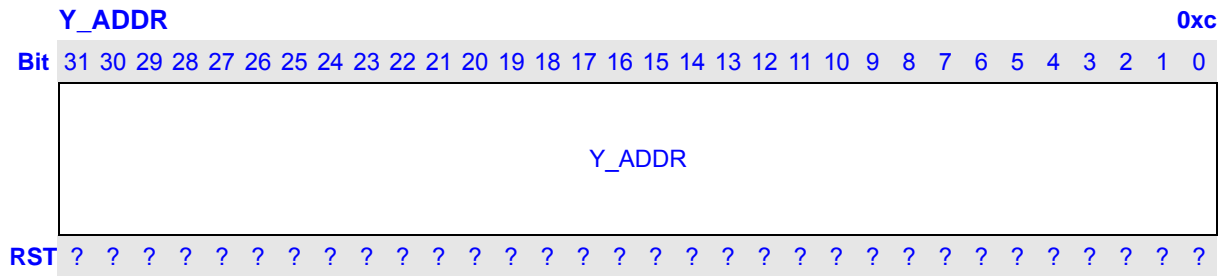

NOTE: If IPU_CONTROL.FM_IRQ_EN has been set 1, once OUT_END is set value 1 which denotes a frame's post process done, an low level active interrupt request will be issued until corresponding software handler clear OUT_END to value 0.

12.5.3 Data Format Register

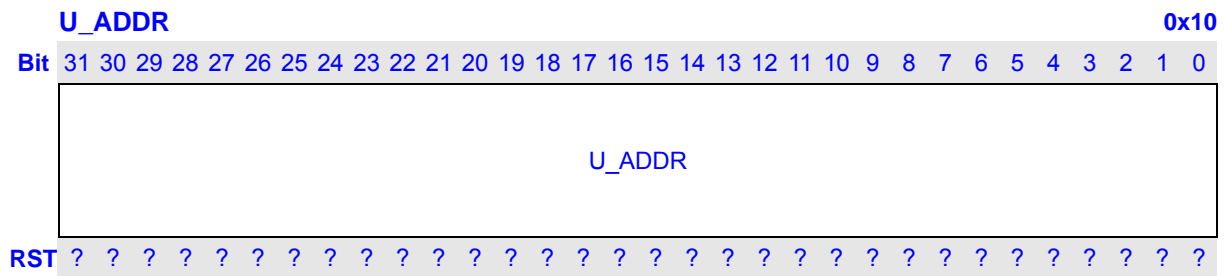

Bits	Name	Description	R/W
31:18	Reserved	Writing has no effect, read as zero.	R
17:16	OUT_FMT	Indicates the destination data format. 00: RGB555 01: RGB565 10: RGB888 11: reserved	RW
15:3	Reserved	Writing has no effect, read as zero.	R
2:0	IN_FMT	Indicates the source data format. 000: YUV 4:2:0 001: YUV 4:2:2 010: YUV 4:4:4 011: YUV 4:1:1 100: YCbCr 4:2:0 101: YCbCr 4:2:2 110: YCbCr 4:4:4 111: YCbCr 4:1:1	RW

12.5.4 Input Y Data Address Register

Bits	Name	Description	R/W
31:0	Y_ADDR	The source Y data buffer's start address.	RW

12.5.5 Input U Data Address Register

Bits	Name	Description	R/W
31:0	U_ADDR	The source U data buffer's start address.	RW

12.5.6 Input V Data Address Register

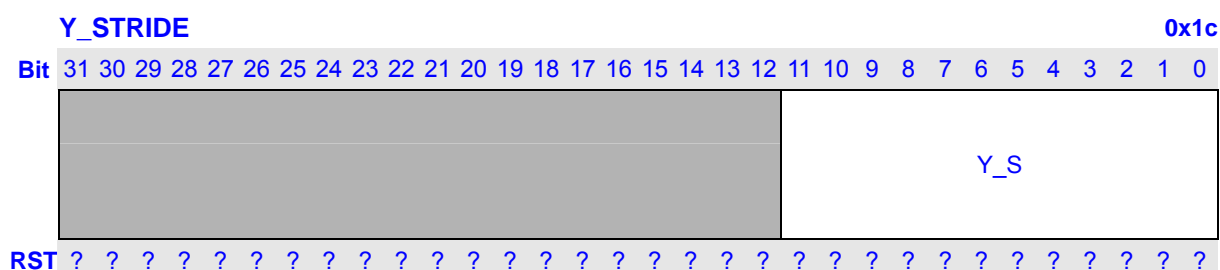

Bits	Name	Description	R/W
31:0	V_ADDR	The source V data buffer's start address.	RW

12.5.7 Input Geometric Size Register

Bits	Name	Description	R/W
31:27	Reserved	Writing has no effect, read as zero.	R
26:16	IN_FM_W	The width of the input frame (unit: byte). Y's width equals this value while the width of U/V or Cb/Cr is calculated by IPU automatically in terms of the source data format.	RW
15:11	Reserved	Writing has no effect, read as zero.	R
10:0	IN_FM_H	The height of the input frame (unit: byte). Y's height equals this value while the height of U/V or Cb/Cr is calculated by IPU automatically in terms of the source data format.	RW

12.5.8 Input Y Data Line Stride Register

Bits	Name	Description	R/W
31:12	Reserved	Writing has no effect, read as zero.	R
11:0	Y_S	The row's stride of the source Y data in the external memory. (unit: byte)	RW

12.5.9 Input UV Data Line Stride Register

Bits	Name	Description	R/W
31:28	Reserved	Writing has no effect, read as zero.	R
27:16	U_S	The row's stride of the source U data in the external memory. (unit: byte)	RW
15:12	Reserved	Writing has no effect, read as zero.	R
11:0	V_S	The row's stride of the source V data in the external memory. (unit: byte)	RW

12.5.10 Output Frame Start Address Register

Bits	Name	Description	R/W
31:0	OUT_ADDR	The output buffer's start address.	RW

12.5.11 Output Geometric Size Register

Bits	Name	Description	R/W
31:30	Reserved	Writing has no effect, read as zero.	R
29:16	OUT_FM_W	The width of the output destination frame (unit: byte).	RW
15:14	Reserved	Writing has no effect, read as zero.	R
13:0	OUT_FM_H	The height of the output destination frame (unit: byte).	RW

12.5.12 Output Data Line Stride Register

OUT_STRIDE

0x2c

Bits	Name	Description	R/W
31:16	Reserved	Writing has no effect, read as zero.	R
15:0	OUT_S	The row's stride of the destination data buffer in the external memory. (unit: byte)	RW

12.5.13 Resize Coefficients Table Index Register

RSZ_COEF_INDEX

0x30

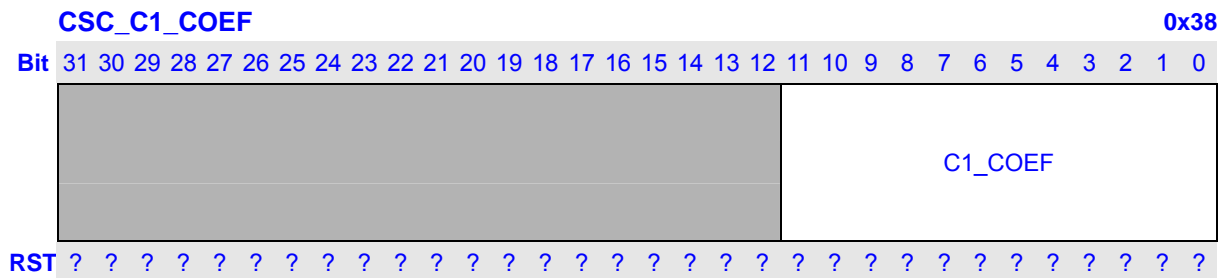

Bits	Name	Description	R/W
31:21	Reserved	Writing has no effect, read as zero.	R
20:16	HE_IDX	Indicates the last valid entry number of the horizontal resize LUT.	RW
15:5	Reserved	Writing has no effect, read as zero.	R
4:0	VE_IDX	Indicates the last valid entry number of the vertical resize LUT.	RW

12.5.14 CSC C0 Coefficient Register

Bits	Name	Description	R/W
31:12	Reserved	Writing has no effect, read as zero.	R
11:0	C0_COEF	The C0 coefficient of the YUV/YCbCr to RGB conversion. C0_COEF = [C0 * 1024 + 0.5]	RW
<p>NOTE:</p> $R = C0*(Y - X0) + C1*(Cr-128)$ $G = C0*(Y - X0) - C2*(Cb-128) - C3*(Cr-128)$ $B = C0*(Y - X0) + C4*(Cb-128)$			

12.5.15 CSC C1 Coefficient Register

Bits	Name	Description	R/W
31:12	Reserved	Writing has no effect, read as zero.	R
11:0	C1_COEF	The C1 coefficient of the YUV/YCbCr to RGB conversion. C1_COEF = [C1 * 1024 + 0.5]	RW
<p>NOTE:</p> $R = C0*(Y - X0) + C1*(Cr-128)$ $G = C0*(Y - X0) - C2*(Cb-128) - C3*(Cr-128)$ $B = C0*(Y - X0) + C4*(Cb-128)$			

12.5.16 CSC C2 Coefficient Register

CSC_C2_COEF

0x3c

Bits	Name	Description	R/W
31:12	Reserved	Writing has no effect, read as zero.	R
11:0	C2_COEF	The C2 coefficient of the YUV/YCbCr to RGB conversion. C2_COEF = [C2 * 1024 + 0.5]	RW
NOTE: R = C0*(Y – X0) + C1*(Cr-128) G = C0*(Y – X0) – C2*(Cb-128) – C3*(Cr-128) B = C0*(Y – X0) + C4*(Cb-128)			

12.5.17 CSC C3 Coefficient Register

CSC_C3_COEF

0x40

Bits	Name	Description	R/W
31:12	Reserved	Writing has no effect, read as zero.	R
11:0	C3_COEF	The C3 coefficient of the YUV/YCbCr to RGB conversion. C3_COEF = [C3 * 1024 + 0.5]	RW
NOTE: R = C0*(Y – X0) + C1*(Cr-128) G = C0*(Y – X0) – C2*(Cb-128) – C3*(Cr-128) B = C0*(Y – X0) + C4*(Cb-128)			

12.5.18 CSC C4 Coefficient Register

RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
31:13	Reserved	Writing has no effect, read as zero.	R
9:2	W_COEF	Weighting coefficients, 8 bits length, that is to say the precision is 1/128. For up-scaling, $W_k = 1 - (k*n/m - [k*n/m]), k = 0, 1, \dots, m-1.$ For down-scaling, for (t=0, k=0; k < n; k++) { If (([t*n+1]/m) - k >= 1) { $W_k = 0;$ } else if ((t*n+1)/m - k == 0) { $W_k = 1;$ t++; } else { $W_k = 1 - ((t*n+1)/m - [t*n/m]);$ t++; } } $W_COEF_k = [128 * W_k]$	RW

		<p>Here n stands for original pixel points, m stands for pixel points after resize. For example down-scaling 5:3, n = 5, m = 3. Moreover, m and n are prime, that is, for example 8:2 should be converted to 4:1.</p> <p>When IPU_CONTROL.RSZ_EN set as 1 and m:n = 1:1, all coefficients should be calculated as up-scale case.</p>	
1	IN_EN	<p>Flag for whether new pixel would be used.</p> <p>IN_EN = 0, no new pixel IN_EN = 1, one new pixel</p> <p>In down scale case, IN_EN always equals 1.</p> <p>In up scale case,</p> <pre> For (i=0, k=0; k < m; k++) { If(i <= k*n/m) { IN_EN_k = 1; i++;} else { IN_EN_k = 0;} } </pre>	RW
0	OUT_EN	<p>Flag for whether current interpolation would be output.</p> <p>OUT_EN = 0, current interpolation would not be output OUT_EN = 1, current interpolation would be output</p> <p>In up scale case, OUT_EN always equals 1.</p> <p>In down scale case,</p> <pre> For (t=0, k=0; k < n; k++) { If([(t*n+1)/m] - k >= 1) OUT_EN_k = 0; else {OUT_EN_k = 1; t++;} } </pre>	RW

NOTE:

The coefficient number equals to max (m, n). HLUT (horizontal look up table) and VLUT (vertical look up table) are independent, so the two tables may have different coefficient number. Therefore,

RSZ_COEF_INDEX.VIDX = The coefficient number of VLUT – 1

RSZ_COEF_INDEX.HIDX = The coefficient number of HLUT – 1

Moreover, when m=1 for down-scaling, discard above formula and use following rules:

- 1 W_COEF₀ = 64 (W₀ = 0.5), and W_COEF_{1~n-1} = 0.
- 2 IN_EN always equals 1.
- 3 OUT_EN₀ = 1, and OUT_EN_{1~n-1} = 0.

Following are two examples of setting LUT:

Resize coefficients for 7:3

W	W_COEF	IN_EN	OUT_EN	Pixel 1	Pixel 2	OUT
2/3	85	1	1	P [0]	P [1]	P [0] * 2/3 + P [1] * 1/3
0	0	1	0	P [1]	P [2]	No new pixel out
1/3	42	1	1	P [2]	P [3]	P [2] * 1/3 + P [3] * 2/3
0	0	1	0	P [3]	P [4]	No new pixel out
0	0	1	0	P [4]	P [5]	No new pixel out
1	128	1	1	P [5]	P [6]	P [5] * 1 + P [6] * 0
0	0	1	0	P [6]	P [7]	No new pixel out

Resize coefficients for 3:5

W	W_COEF	IN_EN	OUT_EN	Pixel 1	Pixel 2	OUT
1	128	1	1	P [0]	P [1]	P [0] * 1 + P [1] * 0
2/5	51	0	1	P [0]	P [1]	P [0] * 2/5 + P [1] * 3/5
4/5	102	1	1	P [1]	P [2]	P [1] * 4/5 + P [2] * 1/5
1/5	25	0	1	P [1]	P [2]	P [1] * 1/5 + P [2] * 4/5
3/5	76	1	1	P [2]	P [3]	P [2] * 3/5 + P [3] * 2/5

12.5.20 Vertical Resize Coefficients Look Up Table Register group

Function descriptions are same as horizontal LUT.

12.6 Calculation for Resized width and height

For software, to preset correct value for register OUT_GS, please refer to following formula.

Set IW stand for original input frame width, IH stand for original input frame height, OW stand for new frame width after resize, OH stand for new frame height after resize.

In Up-scale case ($n < m$):

If $[(IW - 1) * (m/n)] * (n/m) == (IW-1)$ then

OW = $[(IW - 1) * (m/n)] + 1$;

Else OW = $[(IW - 1) * (m/n)] + 2$;

If $[(IH - 1) * (m/n)] * (n/m) == (IH-1)$ then

OH = $[(IH - 1) * (m/n)] + 1$;

Else OH = $[(IH - 1) * (m/n)] + 2$;

In Down-scale case ($n > m$):

If $[(IW - 1) * (m/n)] * (n/m) == (IW-1)$ then

OW = $[(IW - 1) * (m/n)]$;

Else OW = $[(IW - 1) * (m/n)] + 1$;

If $[(IH - 1) * (m/n)] * (n/m) == (IH-1)$ then

OH = $[(IH - 1) * (m/n)]$;

Else OH = $[(IH - 1) * (m/n)] + 1$;

For example:

A 36x46 frame with the horizontal resize ratio of 4:5 (up-scale) and vertical resize ratio of 7:6 (down-scale), by the expressions above we get its new size after resize from the following process.

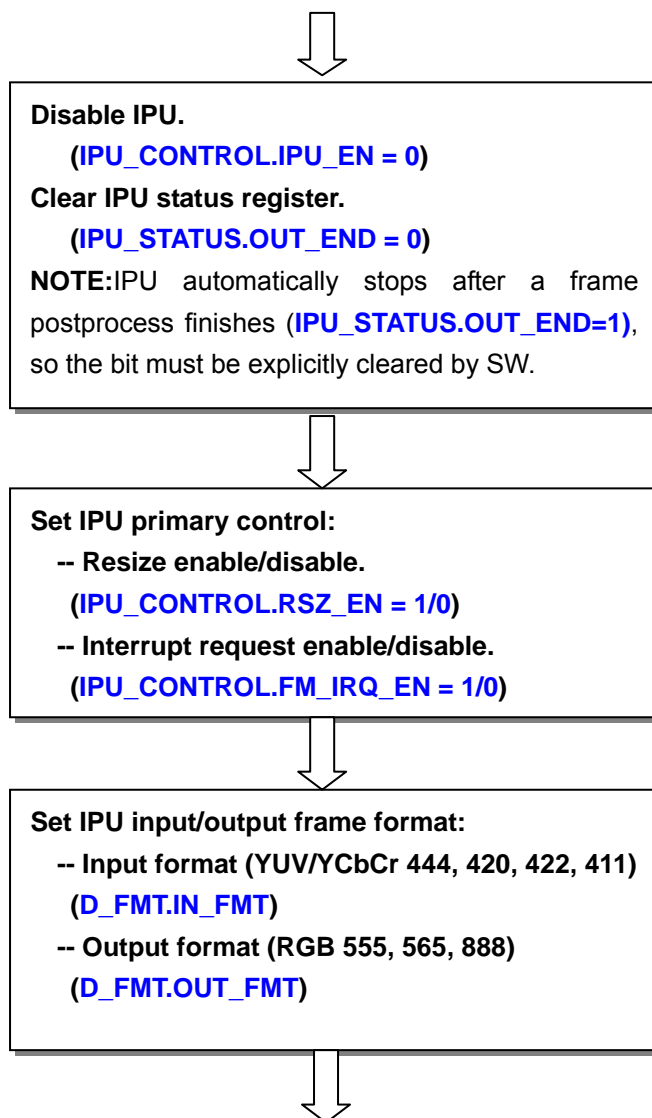

For Width: $[(36 - 1) * (5/4)] * (4/5) = 34.4 \neq (36-1)$

So OW = $[(36 - 1) * (5/4)] + 2 = 45$

For Height: $[(46 - 1) * (6/7)] * (7/6) = 44.33 \neq (46 - 1)$

So OH = $[(46 - 1) * (6/7)] + 1 = 39$

12.7 IPU Initialization Flow

↓

Set input frame size:

- Input frame width (Eg: 288x188 frame)
(**IN_FM_GS.IN_FM_W = 288**)
- Input frame height (Eg: 288x188 frame)
(**IN_FM_GS.IN_FM_H = 188**)
- Y frame stride (**Y_STRIDE.Y_S**)
- U frame stride (**UV_STRIDE.U_S**)
- V frame stride (**UV_STRIDE.V_S**)

NOTE: Frame width/height value should be restricted according to frame format (ensure it is a legal size). In the case of 411 the value should be multiple of 4. In the case of 420/422 the value should be multiple of 2. In the case of 444 the value can be any integer in the legal range (33 ~ 2047). Moreover, the stride value should be set to ensure frames' every line start address are word aligned.

↓

Set input/output data start address:

- Y frame start address (**Y_ADDR.Y_ADDR**)
- U frame start address (**U_ADDR.U_ADDR**)
- V frame start address (**V_ADDR.V_ADDR**)
- Output frame start address
(**OUT_ADDR.OUT_ADDR**)

NOTE: Y/U/V frame start address must be word aligned. Output frame start address can be half-word or word aligned except RGB888 format, which should be word

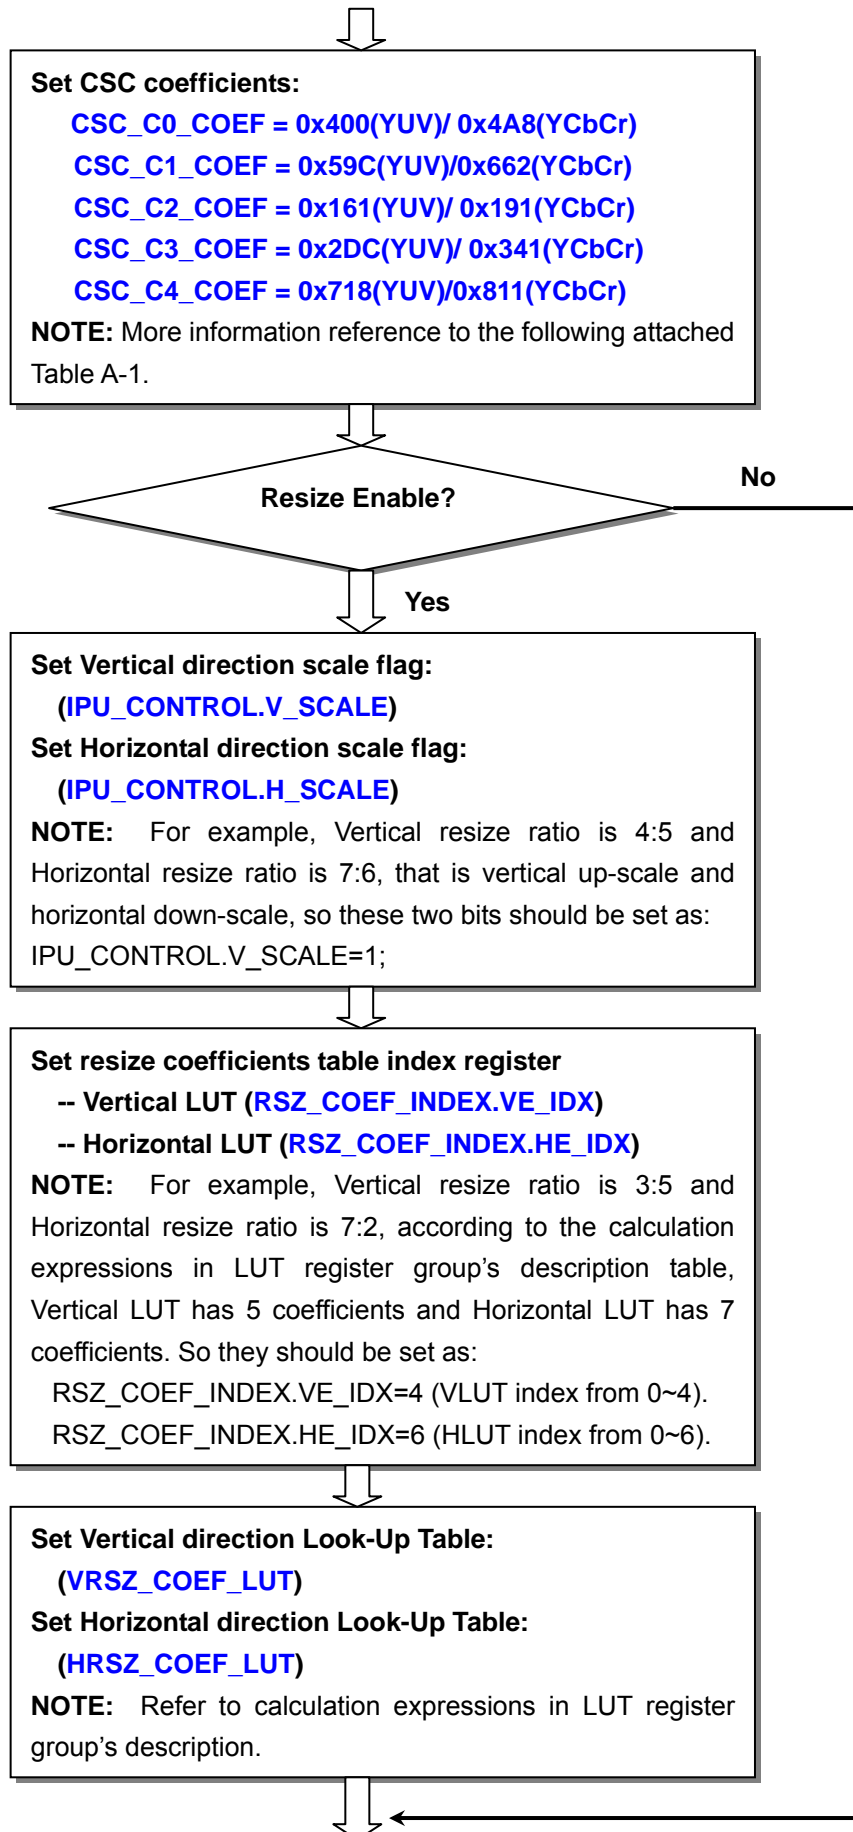

↓

Set output frame size:

- Output frame width
(**OUT_GS.OUT_FM_W**)
- Output frame height
(**OUT_GS.OUT_FM_H**)
- Output frame stride
(**OUT_STRIDE.OUT_S**)

NOTE: Since the unit is byte, the exact values filled in are the pixel numbers left shifted by 1 or 2 according to output format. For example: RGB888, each pixel takes 4 bytes, so the width value is pixel numbers * 4. Hence, a RGB888 format output frame with size of 120x80 and stride of 124, their value should be filled as:
OUT_GS.OUT_FM_W=120<<2;

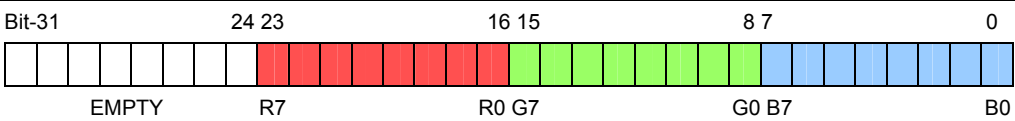

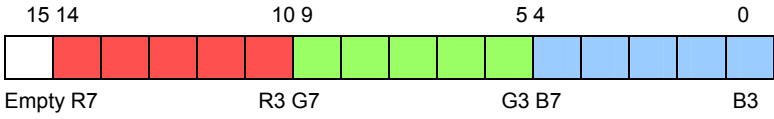

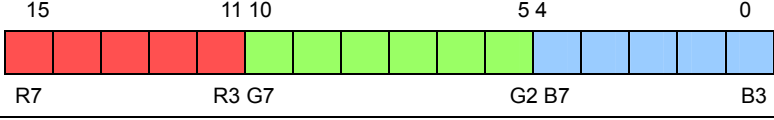

↓

Table 12-1 YUV/YCbCr to RGB CSC Equations

Input data	Matrix	CSC_COEF register values
YUV	$R = C0*(Y - X0) + C1*(V-128)$ $G = C0*(Y - X0) - C2*(U-128) - C3*(V-128)$ $B = C0*(Y - X0) + C4*(U-128)$ X0: 0 C0: 1 C1: 1.4026 C2: 0.3444 C3: 0.7144 C4: 1.7730	CSC_C0_COEF = 0x400 CSC_C1_COEF = 0x59C CSC_C2_COEF = 0x161 CSC_C3_COEF = 0x2DC CSC_C4_COEF = 0x718
YCbCr	$R = C0*(Y - X0) + C1*(Cr-128)$ $G = C0*(Y - X0) - C2*(Cb-128) - C3*(Cr-128)$ $B = C0*(Y - X0) + C4*(Cb-128)$ X0: 16 C0: 1.164 C1: 1.596 C2: 0.391 C3: 0.813 C4: 2.018	CSC_C0_COEF = 0x4A8 CSC_C1_COEF = 0x662 CSC_C2_COEF = 0x191 CSC_C3_COEF = 0x341 CSC_C4_COEF = 0x811

Table 12-2 Output data package format

Format	Package
RGB888	 <p>Bit-31 24 23 16 15 8 7 0</p> <p>EMPTY R7 R0 G7 G0 B7 B0</p>
RGB555	 <p>15 14 10 9 5 4 0</p> <p>Empty R7 R3 G7 G3 B7 B3</p>
RGB565	 <p>15 11 10 5 4 0</p> <p>R7 R3 G7 G2 B7 B3</p>

NOTE:
All R/G/B data are little-endian type; all the empty bits in the above figure are filled with 0.

Example: YUV420 118x80 frame

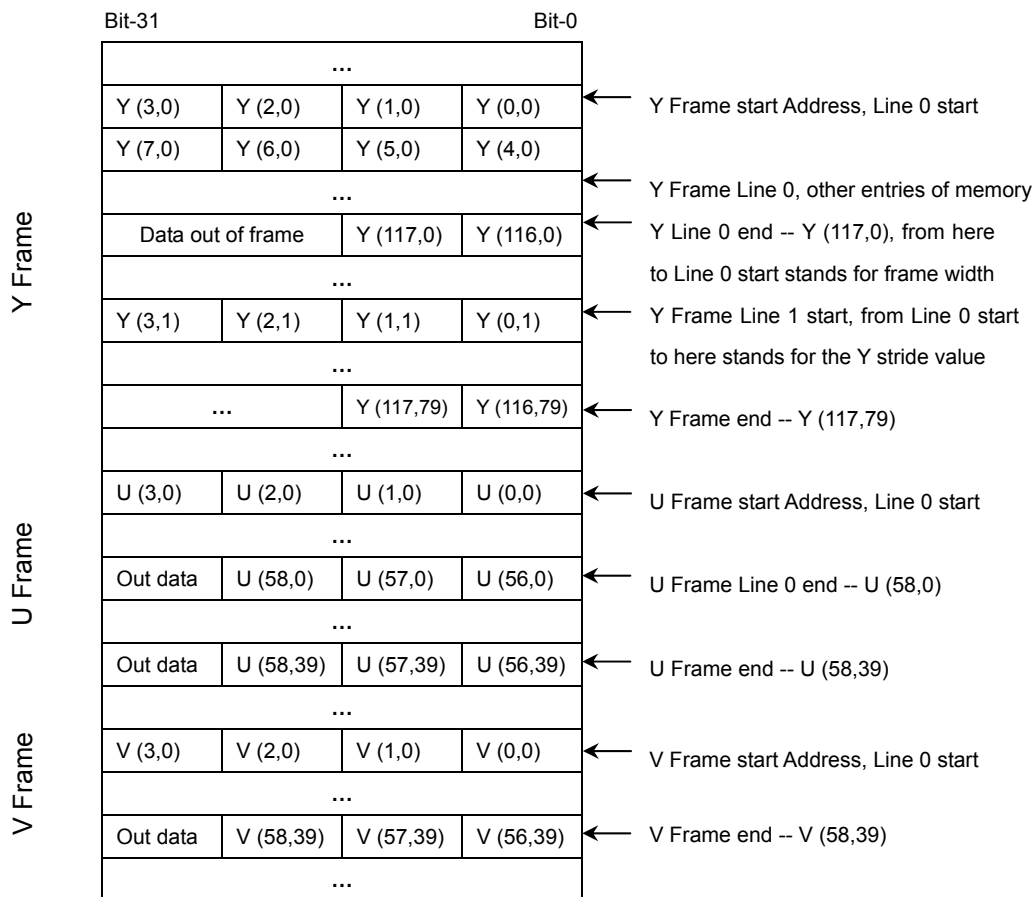

Figure 12-1 Source Data storing format in external memory

NOTES:

- 1 Every line's start address should be word aligned.
- 2 All pixel data should be stored as little-endian format.
- 3 Destination data (RGB) storing format in external memory is similar with above figure, but RGB555 and RGB565 frame's every line start address can be half-word aligned (RGB888 frame still need word aligned).

13 Internal CODEC

13.1 Overview

This chapter describes internal audio CODEC embedded in the processor and related software interface.

The internal CODEC is an I2S audio CODEC with 18 bits DAC and 16 bits ADC. It also has several memory mapped registers used to control and configure the CODEC. AIC is used to interface to the CODEC for audio data replaying and recording.

13.1.1 Features

The following are internal CODEC features:

- DAC
 - 18 bits sample size, SNR 90dB
- ADC
 - 16 bits sample size, SNR 85dB
- Sample rate
 - 8kHz, 11.025kHz, 12kHz, 16kHz, 22.05kHz, 24kHz, 32kHz, 44.1kHz and 48kHz
- Head phone amplifier to support up to 16ohm load
- Anti-pop for head phone out
- Low power dissipation mode
- Digital volume control

13.1.2 Signal Descriptions

CODEC has 5 ~ 7 signal IO pins depending on various chips. They are listed and described in Table 13-1.

Table 13-1 CODEC signal IO pin description

Pin Names	IO	4740 Loc	4720 Loc	IO Cell Char.	Pin Description	Power
LHPO	AO	E14			LHPO: Left headphone out	VDD _{CDC}
RHPO	AO	E13			RHPO: Right headphone out	VDD _{CDC}
MICIN	AI	D14			MICIN: Microphone input	VDD _{CDC}
MICBIAS	AO	E15			MICBIAS: Microphone bias	VDD _{CDC}
LLINEIN	AI	D12			LLINEIN: Left line input	VDD _{CDC}
RLINEIN	AI	D13			RLINEIN: Right line input	VDD _{CDC}
VREF	AO	E12			VREF: Voltage Reference Output. An electrolytic	VDD _{CDC}

Pin Names	IO	4740 Loc	4720 Loc	IO Cell Char.	Pin Description	Power
					capacitor more than 10 μ F in parallel with a 0.1 μ F ceramic capacitor attached from this pin to VSSCDC eliminates the effects of high frequency noise	
VDDHP	P	G12			VDDHP: Headphone amplifier power, 3.3V	-
VSSHP	P	G10			VSSHP: Headphone amplifier ground	-
VDDCDC	P	D11			VDDCDC: CODEC analog power, 3.3V	-
VSSCDC	P	F9			VSSCDC: CODEC analog ground	-

13.1.3 Block Diagram

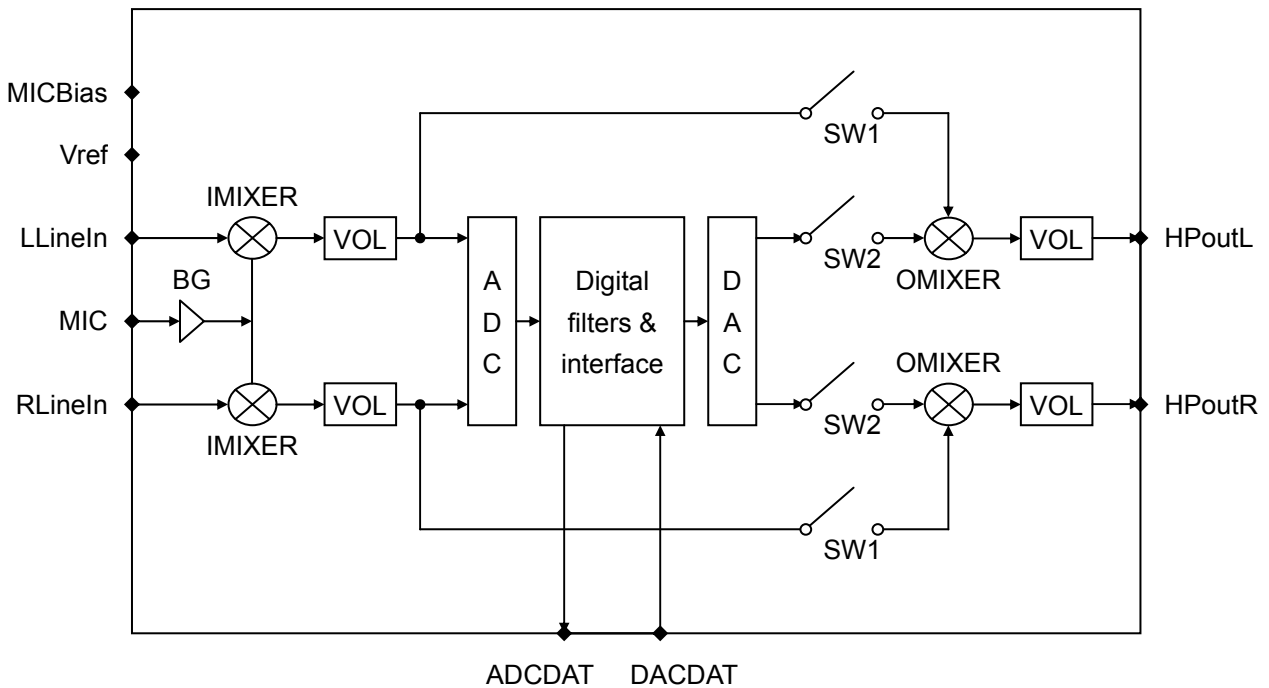

Figure 13-1 CODEC block diagram

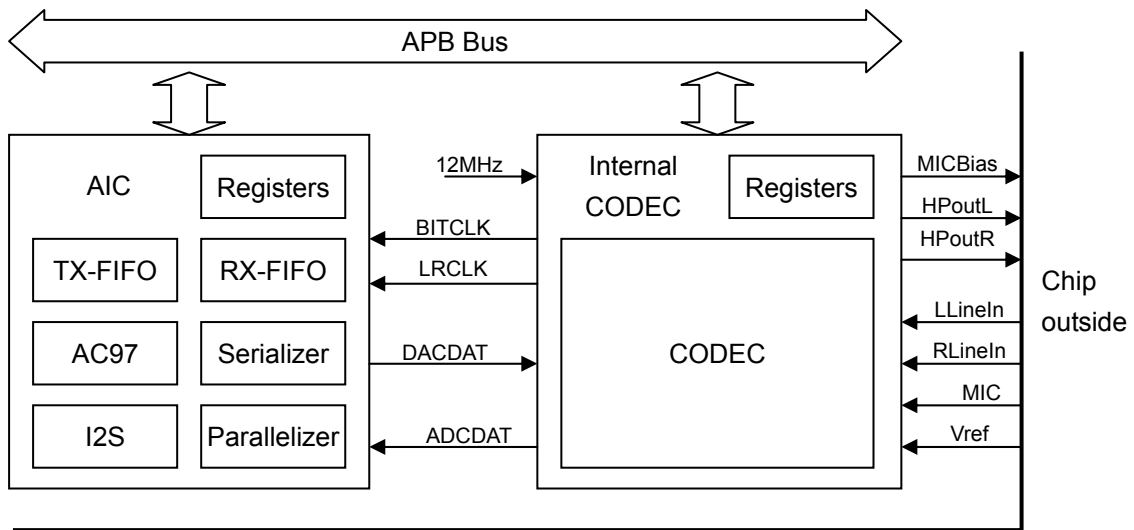

Figure 13-2 Internal CODEC works with AIC

13.2 Register Descriptions

The internal CODEC software interface includes 2 registers. They are mapped in IO memory address space so that program can access them to control the operations of the CODEC.

Table 13-2 Internal CODEC Registers Description

Name	Description	RW	Reset value	Address	Size
CDCCR1	CODEC Control Register 1	RW	0x021B2302	0x10020080	32
CDCCR2	CODEC Control Register 2	RW	0x00170803	0x10020084	32

- CDCCR1 is used to control MIC input, LINE input, headphone out, ADC, DAC, CODEC suspend/reset and anti-pop procedures.
- CDCCR2 is used to control values or gains of MIC input, LINE input and headphone, and audio sample rate.

13.2.1 CODEC Control Register 1 (CDCCR1)

CDCCR1 contains bits to control MIC input, LINE input, headphone out, ADC, DAC, CODEC suspend/reset and anti-pop procedures. Set AICFR.ICDC to 1 before write to this register, or the effect is undefined.

CDCCR1															0x10020080

13.2.2 CODEC Control Register 2 (CDCCR2)

CDCCR2 contains bits to control values or gains of MIC input, LINE input and headphone, and audio sample rate. Set AICFR.ICDC to 1 before write to this register, or the effect is undefined.

Bits	Name	Description	RW																
31:21	Reserved	Writes to these bits have no effect and always read as 0.	R																
20:16	AINVOL	The audio input programmable gain amplifier volume control. It influences both MIC input and line input volume. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>AINVOL</th> <th>Gain</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>-34.5 dB</td> </tr> <tr> <td>1</td> <td>-33.0 dB</td> </tr> <tr> <td>...</td> <td>(AINVOL * 1.5) – 34.5</td> </tr> <tr> <td>23</td> <td>0 dB</td> </tr> <tr> <td>...</td> <td>...</td> </tr> <tr> <td>30</td> <td>+10.5 dB</td> </tr> <tr> <td>31</td> <td>+12.0 dB</td> </tr> </tbody> </table>	AINVOL	Gain	0	-34.5 dB	1	-33.0 dB	... 			10	12 dB			
			11	20 dB			
3:2	Reserved	Writes to these bits have no effect and always read as 0.					R
1:0	HPVOL	Headphone amplifier volume control. In case of HPVOL='b11, the maximum positive sample data produces 0 voltage in HPOUT while maximum negative sample data produces VDDHP voltage. The maximum peak-to-peak voltage is VDDHP. In case of HPVOL='b00, The maximum HPOUT peak-to-peak voltage is half of VDDHP and the middle of the wave is still VREF voltage.					RW
			HPVOL	Gain			
			00	0 dB			
			01	2 dB			
			10	4 dB			
			11	6 dB			

13.3 Operation

The internal CODEC can be accessed by the processor using programmed I/O instructions via memory mapped registers. CODEC memory mapped registers are only for the CODEC controlling. The audio data transferring, i.e. audio replaying and recording, is down by AIC. AIC still takes the role of I2S controller where CODEC memory mapped registers take the role of CODEC controlling interface just like L3 bus or I2C bus for an external CODEC. We will refer to many AIC operations and registers in the following audio operation descriptions. Please reference to AIC spec for the details.

13.3.1 Initialization

At power-on or other hardware reset (WDT, wakeup from hibernating mode and etc), The CODEC is reset and is put in suspend mode. The CODEC is also be reset at the time it leaves suspend mode. So if there's error found in the CODEC, set CDCCR.SUSPD to 1 and then set it to 0 will reset CODEC from the error.

To use the internal CODEC with AIC, several AIC registers should be set as:

```
AICFR.ICDC = 1
AICFR.AUSEL = 1
AICFR.BCKD = 0
AICFR.SYNCD = 0
I2SCR.AMSL = 0
```

13.3.2 CODEC controlling and typical operations

Table 13-3 CODEC settings in various applications

1	?	?	?	?	?	?	?	?	?	?	?	?	CODEC is off, no action can be taken

NOTES:

- 1 ^[1]: HP amplifier turn on/turn off procedures are complicate and may produce noise.
- 2 ^[2]: Turn off HP amplifier can save power.

Table 13-3 lists the CODEC settings in many applications. Following are more details for some typical operations.

13.3.2.1 Audio data replay

To replay audio data to the internal CODEC, please consult the following steps.

- 1 Turn HP amplifier on if it is off or the CODEC is suspended.
- 2 Set CDCCR1.ELININ=0, CDCCR1.EMIC=0, CDCCR1.EADC=0, CDCCR1.SW1ON=0, CDCCR1.EDAC=1, CDCCR1.SW2ON=1, CDCCR1.HPMUTE=0.
- 3 Set proper HP amplifier volume CDCCR2.HPVOL.
- 4 Set proper sample rate CDCCR2.SMPR.
- 5 Set proper sample size AICCR.OSS.
- 6 Configure other audio replaying features.
- 7 Configure AIC TX-FIFO, interrupt.
- 8 Setup DMA and interrupt for audio data.
- 9 Set AICCR.ERPL=1 to replay.
- 10 After finished the data replaying, set AICCR.ERPL=0.

13.3.2.2 Audio data replay while record MIC input without playback

To replay audio data to the internal CODEC, in the same time, record audio from the internal CODEC MIC input without playback them, please consult the following steps.

- 1 Turn HP amplifier on if it is off or the CODEC is suspended.
- 2 Set CDCCR1.ELININ=0, CDCCR1.EMIC=1, CDCCR1.EADC=1, CDCCR1.SW1ON=0,

- CDCCR1.EDAC=1, CDCCR1.SW2ON=1, CDCCR1.HPMUTE=0.
- 3 Set proper MIC boost gain volume CDCCR2.MICBG, input amplifier volume CDCCR2.AINVOL and HP amplifier volume CDCCR2.HPVOL.
 - 4 Set proper ADC and DAC sample rate CDCCR2.SMPR.
 - 5 Set proper DAC sample size AICCR.OSS and ADC sample size AICCR.ISS to 16 bits.
 - 6 Configure other audio replaying features.
 - 7 Configure AIC TX-FIFO, RX-FIFO, interrupt.
 - 8 Setup DMA and interrupt for both incoming and outgoing audio data.
 - 9 Set AICCR.ERPL=1 to replay and AICCR.EREC=1 to record.
 - 10 After finished the data replaying, set AICCR.ERPL=0.
 - 11 After finished the record, set AICCR.EREC=0.

13.3.2.3 Playback LINE input audio

To playback audio LINE input in the internal CODEC, please consult the following steps.

- 1 Turn HP amplifier on if it is off or the CODEC is suspended.
- 2 Set CDCCR1.ELININ=1, CDCCR1.EMIC=0, CDCCR1.EADC=0, CDCCR1.SW1ON=1, CDCCR1.EDAC=0, CDCCR1.SW2ON=0, CDCCR1.HPMUTE=0.
- 3 Set proper input amplifier volume CDCCR2.AINVOL and HP amplifier volume CDCCR2.HPVOL.

13.3.2.4 Record LINE input audio with playback

To record audio from the internal CODEC LINE input, in the same time playback them, please consult the following steps.

- 1 Turn HP amplifier on if it is off or the CODEC is suspended.
- 2 Set CDCCR1.ELININ=1, CDCCR1.EMIC=0, CDCCR1.EADC=1, CDCCR1.SW1ON=1, CDCCR1.EDAC=0, CDCCR1.SW2ON=0, CDCCR1.HPMUTE=0.
- 3 Set proper input amplifier volume CDCCR2.AINVOL and HP amplifier volume CDCCR2.HPVOL.
- 4 Set proper sample rate CDCCR2.SMPR.
- 5 Set sample size AICCR.ISS to 16 bits.
- 6 Configure other audio record features.
- 7 Configure AIC RX-FIFO, interrupt.
- 8 Setup DMA and interrupt for audio data.
- 9 Set AICCR.EREC=1 to record.
- 10 After finished the record, set AICCR.EREC=0.

13.3.2.5 Record MIC input audio without playback 2

To record audio from the internal CODEC MIC input without playback them, please consult the following steps.

- 1 If HP amplifier is on, turn it off.
- 2 Set CDCCR1.SUSPD=0, CDCCR1.ELININ=0, CDCCR1.EMIC=1, CDCCR1.EADC=1, CDCCR1.EDAC=0.
- 3 Set proper MIC boost gain volume CDCCR2.MICBG and input amplifier volume CDCCR2.AINVOL.
- 4 Set proper sample rate CDCCR.SMPR.
- 5 Set sample size AICCR.ISS to 16 bits.
- 6 Configure other audio record features.
- 7 Configure AIC RX-FIFO, interrupt.
- 8 Setup DMA and interrupt for audio data.
- 9 Set AICCR.EREC=1 to record.
- 10 After finished the record, set AICCR.EREC=0.

13.3.3 Power saving

13.3.4 Pop noise and the reduction of it

The internal CODEC includes an amplifier for headphone output. The pop noise when headphone amplifies turning on and turning off (power on/off) is normally an issue for an audio CODEC. In this processor, we provide several approaches to reduce the pop noise.

The sound of the headphone depends on the voltage change of the HPOUT pins. The HPOUT voltage changing speed decides the sound tune and the changing range decides the sound magnitude. VREF is the reference voltage. It will be V_m , the half of VDDCDC and is the middle voltage of HPOUT when CODEC is working. The HPOUT and VREF voltage should be bring to V_m after this chip and the CODEC power on and before play audio from it. No noise will be found when start play audio in case of HPOUT and VREF are V_m . So the key point is bringing VREF and HPOUT to V_m in a noise free and fast procedure.

13.3.4.1 Charge and discharge of VREF and HPOUT

The timing values listed in the following tables are measured in the condition of:

- Two 220uF capacitors are connected to HPOUTL and HPOUTR pins respectively.
- 0.1uF + 10uF capacitors are connected to VREF pin.
- Room temperature.

The standard deviation (σ) of the timing is also listed as well as the average timing value. According to statistical theory, the average timing $\pm 3\sigma$ covers 99.7% cases, $\pm 4\sigma$ covers 99.994% cases. So the (average + 4σ) timing value is recommended.

Table 13-4 Charge VREF to the middle voltage V_m

Operation	Timing	No Noise Condition
Set CDCCR1 = 0x000b2302	VREF 0→ V_m : $0.8 \pm ?s$	
Set CDCCR1 = 0x00002302?	VREF 0→ V_m : $50 \pm ?ms?$	

NOTES:

- 1 In case of CDCCR1 = 0x000b2302, the whole CODEC power consumption is about 410uA.
- 2 In case of CDCCR1 = 0x00002302, the whole CODEC power consumption is about ?uA.

Table 13-5 Charge HPOUT to the middle voltage V_m

Operation	Timing	No Noise Condition
Replay data from 0x1FFFFF to 0	HPOUT 0→ V_m : $500 \pm ?ms$	VREF = V_m , HPOUT start from 0V, CDCCR2.HPVOL=3, CDCCR1.HPOV0=0

Table 13-6 Charge VREF and HPOUT to the middle voltage Vm

Operation	Timing	No Noise Condition
Set CDCCR1 = 0x00033302	VREF 0→Vm: $0.8 \pm ?s$ HPOUT 0→Vm: $1.5 \pm ?s$	Both VREF and HPOUT start from 0V
	HPOUT (Vm – 0.1V)→Vm: $0.7 \pm ?s$	VREF = Vm, HPOUT > (Vm – 0.1V)

NOTE: In case of CDCCR1 = 0x00033302, the whole CODEC power consumption is about 1mA.

Table 13-7 Discharge HPOUT to 0V

Operation	Timing	No Noise Condition
Set CDCCR1 = 0x001b2102	HPOUT Vm→0: $1.7 \pm ?s$	Change to CDCCR1 = 0x001b2302 first

NOTE: In case of CDCCR1 = 0x001b2102, the whole CODEC power consumption is < 0.1uA.

Table 13-8 Discharge VREF to 0V

Operation	Timing	No Noise Condition
Set CDCCR1 = 0x001f2302	VREF Vm→0: $3 \pm ?ms$	

NOTE: In case of CDCCR1 = 0x001f2302, the whole CODEC power consumption is < 0.1uA.

Table 13-9 Discharge VREF and HPOUT to 0V

Operation	Timing	No Noise Condition
Set CDCCR1 = 0x001f2102	HPOUT Vm→0: $1.7 \pm ?s$ VREF Vm→0: $3 \pm ?ms$	Change to CDCCR1 = 0x001b2302 first

NOTE: In case of CDCCR1 = 0x001f2102, the whole CODEC power consumption is about 500uA.

13.3.4.2 Leakage of HPOUT and VREF

Set CDCCR1 to 0x001b2302 after HPOUT and VREF are charged Vm, the electrons in HPOUT and VREF capacitors will leak slowly and the voltage will be down slowly. The voltage down speed is greatly depends on the system environment, the HPOUT/VREF capacitance, PCB, capacitor leakage characteristics, temperature, humidity and etc.

Please measure the HPOUT leak 0.1V time, TL01, for your system at the worst case: the highest working temperature and humidity. The steps are:

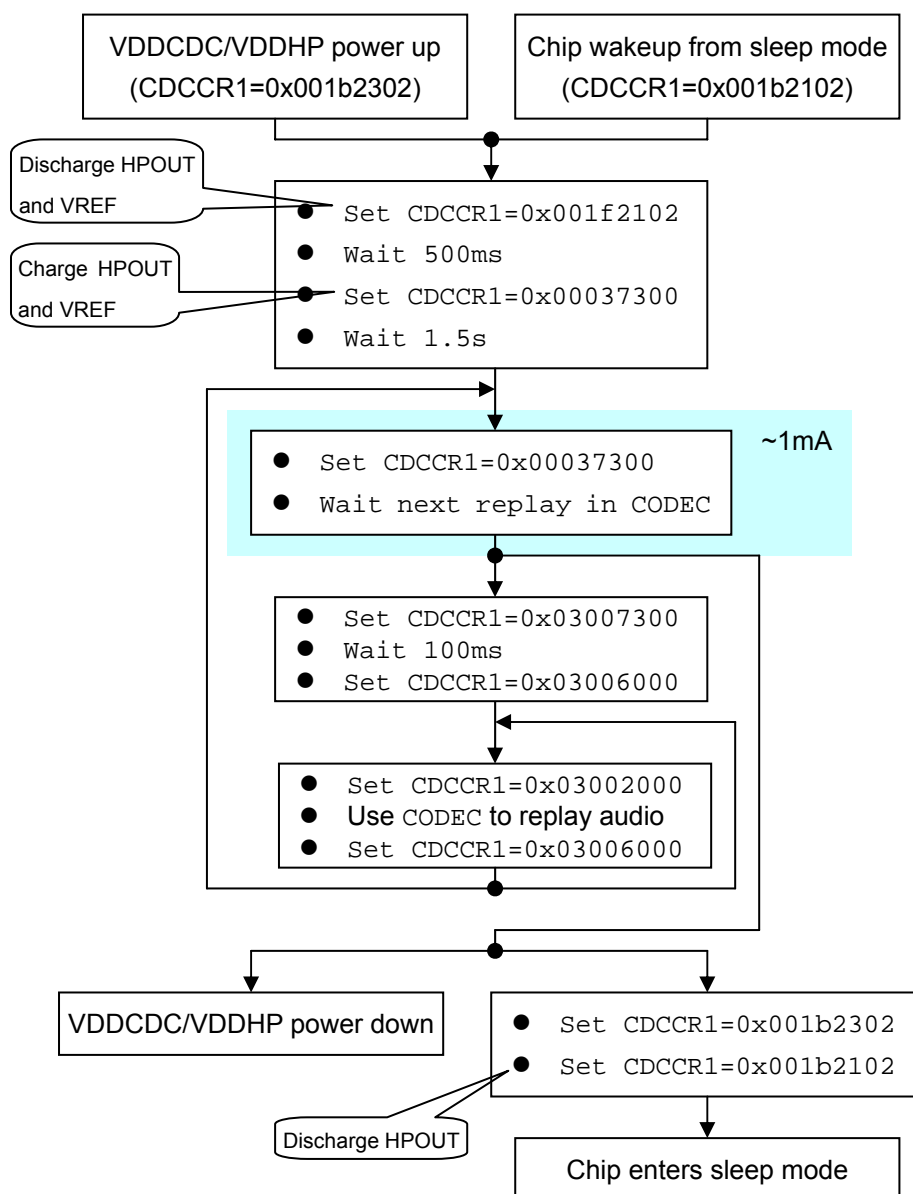

- 1 Set CDCCR1 = 0x00033302, which charge HPOUT to Vm.
- 2 Set CDCCR1 = 0x001b2302 and start count the time.

- 3 When $HPOUT = V_m - 0.1V$, stop count the time. (caution: please notice the voltage measurement instrument causes leakage)

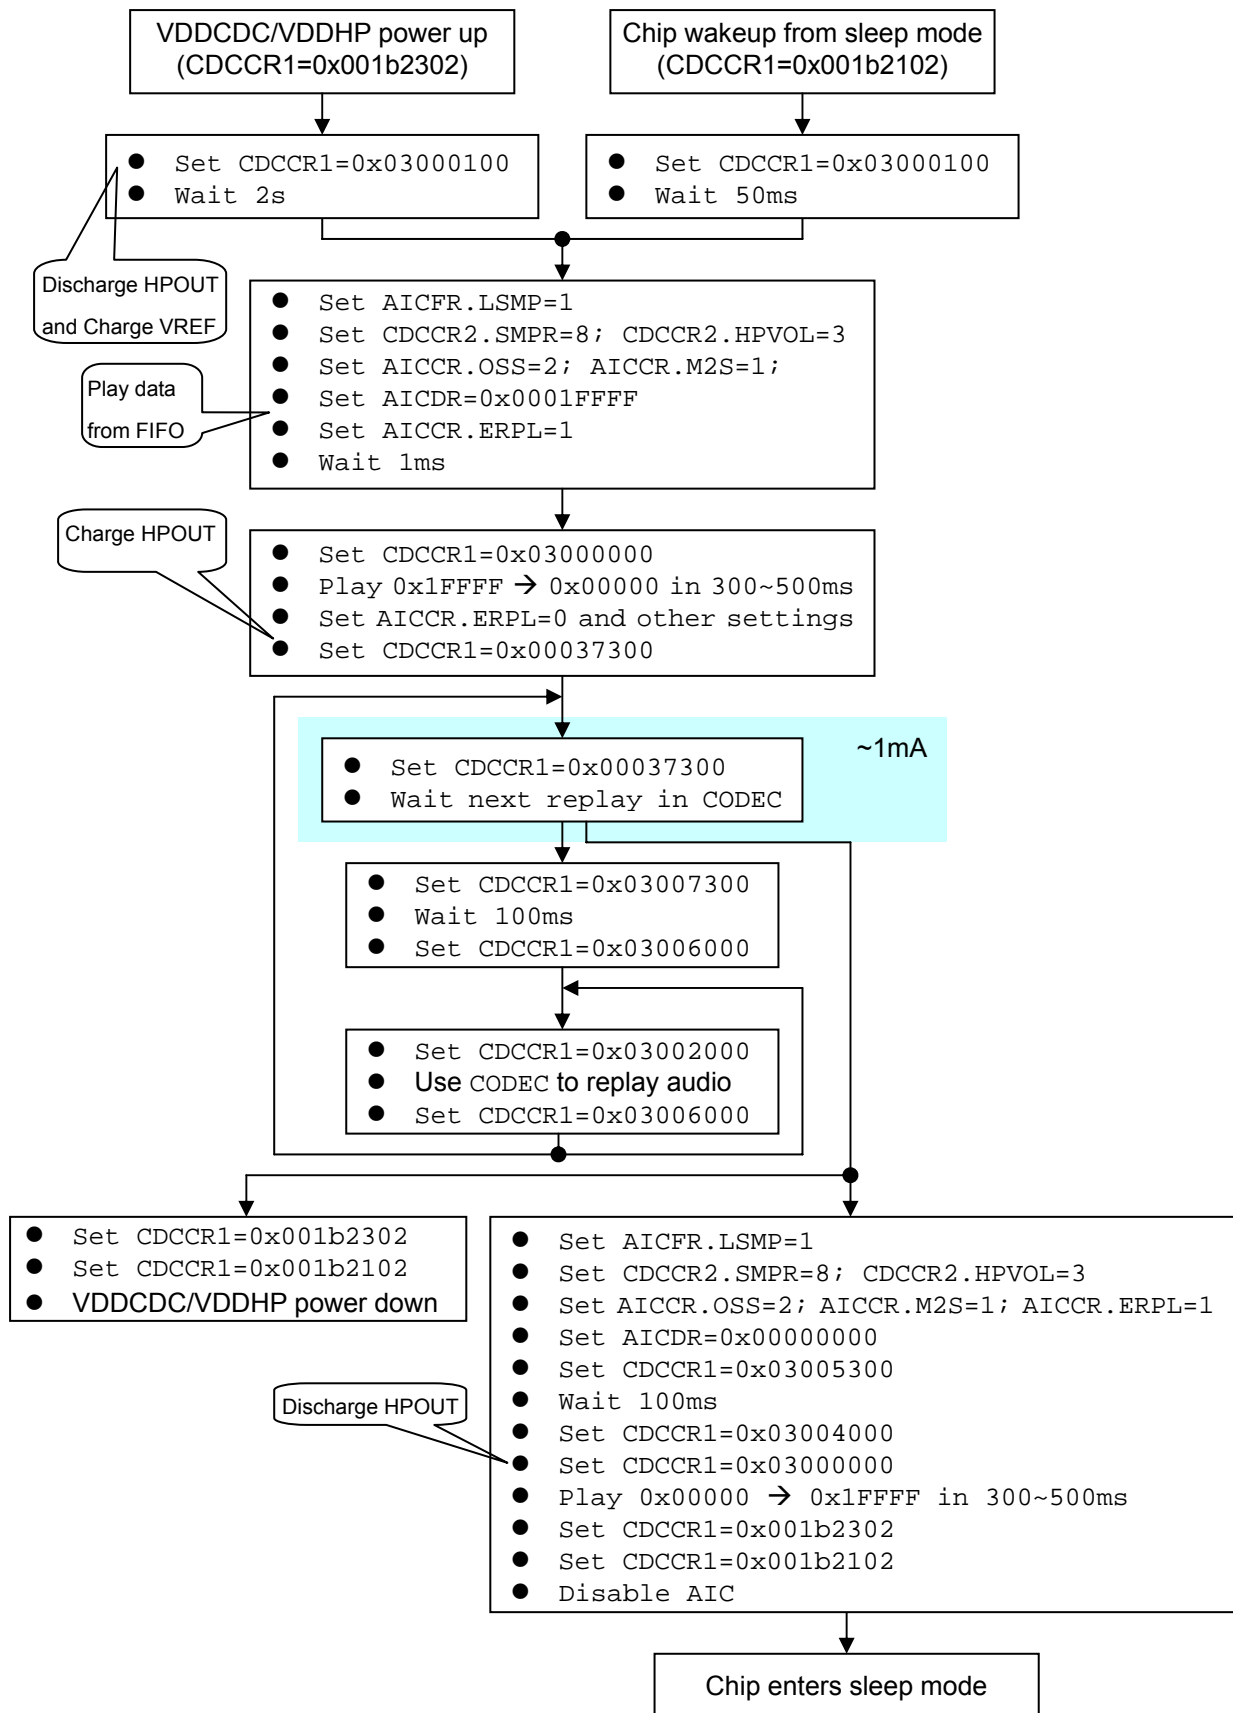

TL01 is the time counted.

This measurement is not needed if user doesn't use complex anti-pop approach.

13.3.4.3 Simple-slow anti-pop approach

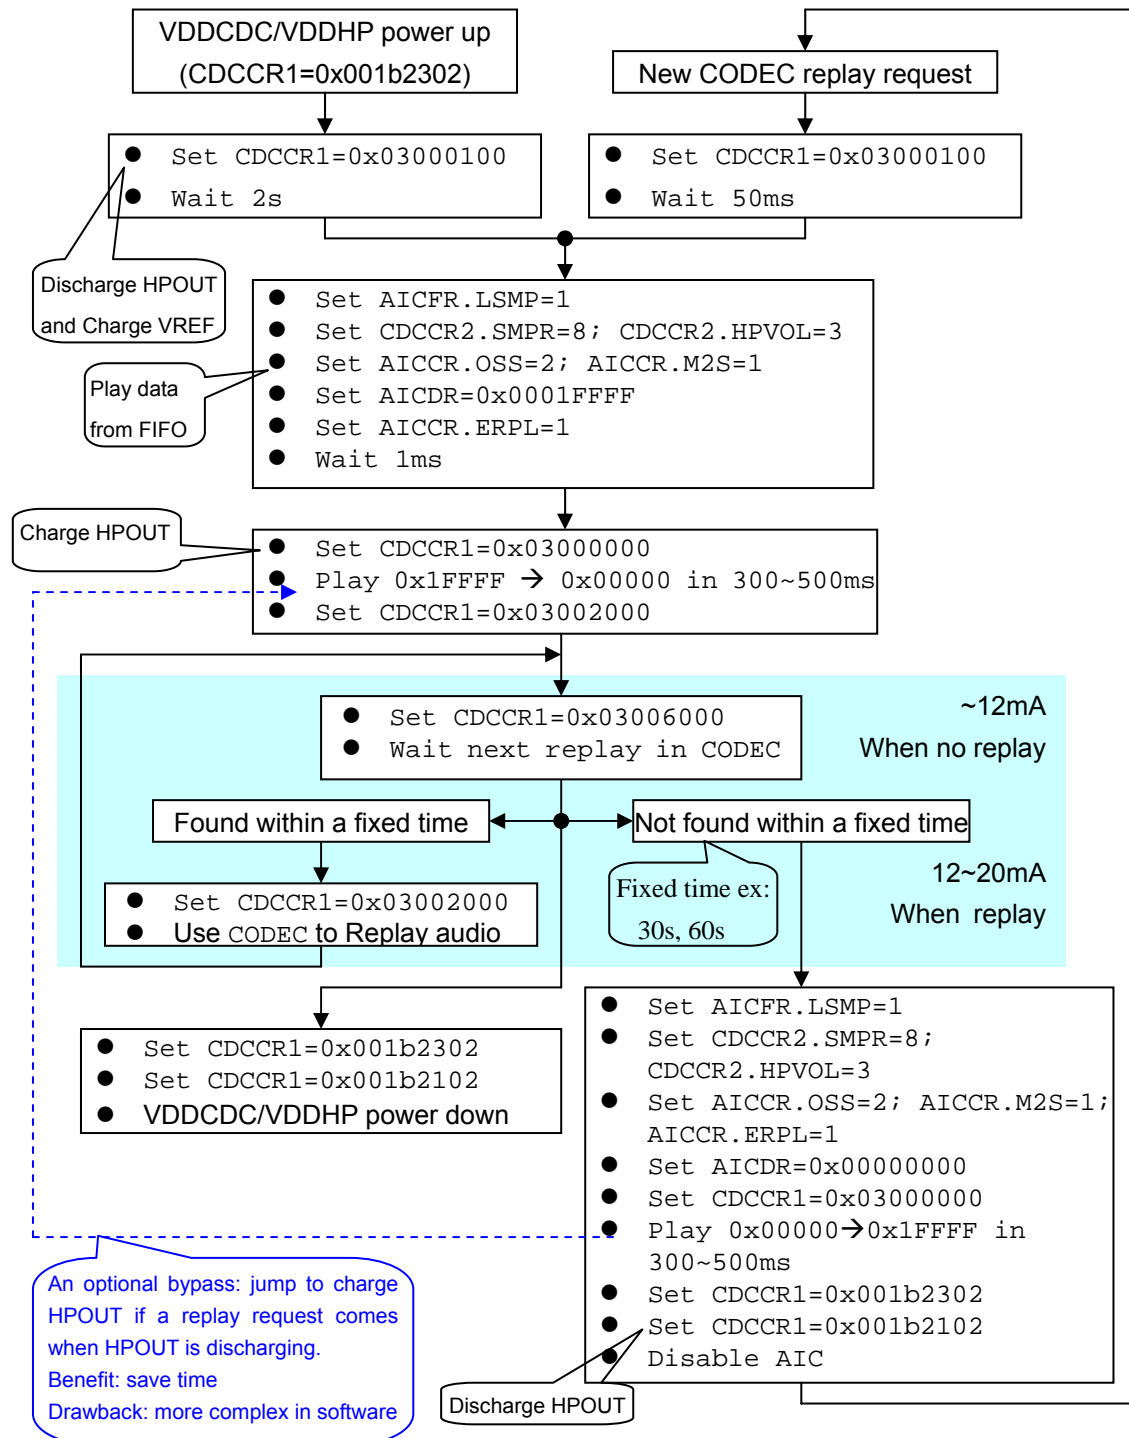

13.3.4.4 Simple-fast anti-pop approach

13.3.4.5 Improved anti-pop approach

There is a small pop (about 20~30mV voltage change in HPOUT) when CDCCR1 changed from 0x00033302 to 0x03002000. This approach eliminates this pop.

13.3.4.6 Complex anti-pop approach

13.4 Timing parameters

13.5 AC & DC parameters

14 AC97/I2S Controller

14.1 Overview

This chapter describes the AIC (AC'97 and I²S Controller) included in this processor.

The AIC supports the Audio Codec '97 Component Specification 2.3 for AC-link format and I2S or IIS (for inter-IC sound), a protocol defined by Philips Semiconductor. Both normal I2S and the MSB-justified I2S formats are supported by AIC.

AIC consists of buffers, status registers, control registers, serializers, and counters for transferring digitized audio between the processor's processor system memory and an internal I2S CODEC, an external AC97 or I2S CODEC. AIC can record digitized audio by storing the samples in system memory. For playback of digitized audio or production of synthesized audio, the AIC retrieves digitized audio samples from system memory and sends them to a CODEC through the serial connection with AC-link or I2S formats. The internal or external digital-to-analog converter in the CODEC then converts the audio samples into an analog audio waveform. The audio sample data can be stored to and retrieved from system memory either by the DMA controller or by programmed I/O.

The AC-link is a synchronous, fixed-rate serial bus interface for transferring CODEC register control and status information in addition to digital audio. Where both normal I2S and MSB-justified-I2S work with a variety of clock rates, which can be obtained either by dividing the PLL clock by two programmable dividers or from an external clock source.

For I2S systems that support the L3 control bus protocol, additional pins are required to control the external CODEC. CODECs that use an L3 control bus require 3 signals: L3_CLK, L3_DATA, and L3_MODE for writing bytes into the L3 bus register. The AIC supports the L3 bus protocol via software control of the general-purpose I/O (GPIO) pins. The AIC does not provide hardware control for the L3 bus protocol.

To control the internal CODEC, internal CODEC spec can be referenced.

This chapter describes the programming model for the AIC. The information in this chapter requires an understanding of the AC'97 specification, Revision 2.3.

14.1.1 Block Diagram

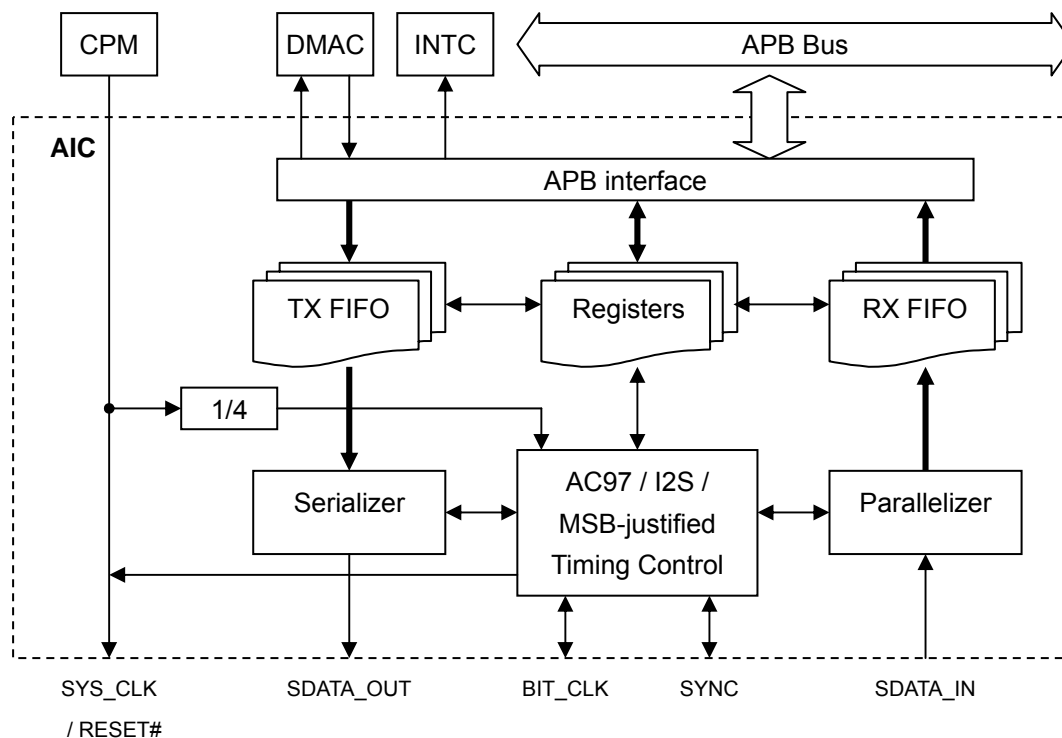

Figure 14-1 AIC Block Diagram

14.1.2 Features

AIC support following AC97/I2S features:

- 8, 16, 18, 20 and 24 bit audio sample data sizes supported
- DMA transfer mode supported
- Stop serial clock supported
- Programmable Interrupt function supported
- Support mono PCM data to stereo PCM data expansion on audio play back
- Support endian switch on 16-bits audio samples play back
- Support variable sample rate in AC-link format
- Multiple channel output and double rated supported for AC-link format
- Power Down Mode and two Wake-Up modes Supported for AC-link format
- Internal programmable or external serial clock and optional system clock supported for I2S or MSB-Justified format
- Internal I2S CODEC supported
- Two FIFOs for transmit and receive respectively with 32 samples capacity in every direction

14.1.3 Interface Diagram

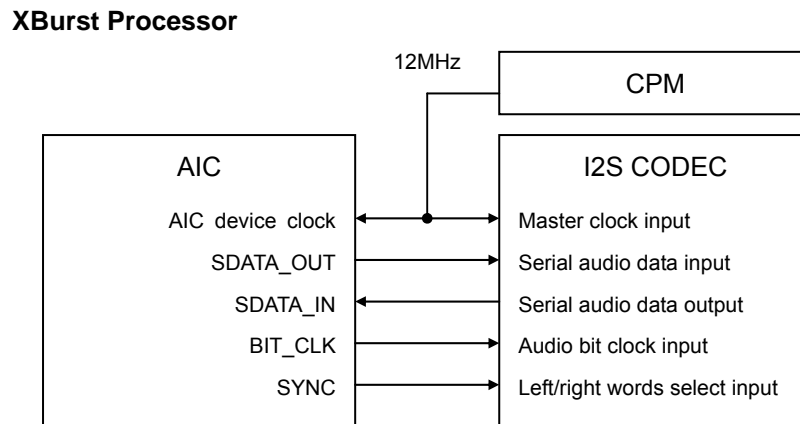

Figure 14-2 Interface to the Internal I2S CODEC Diagram

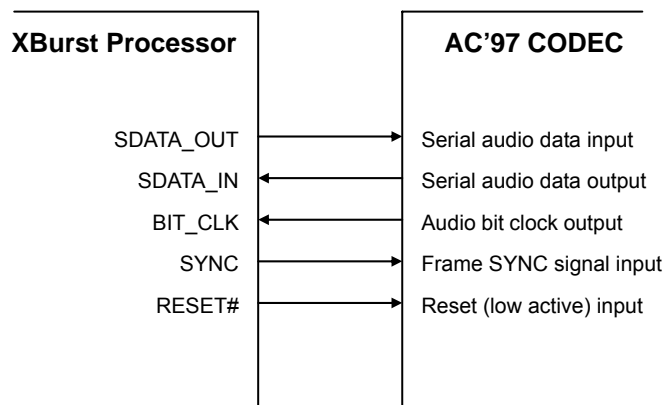

Figure 14-3 Interface to an External AC'97 CODEC Diagram

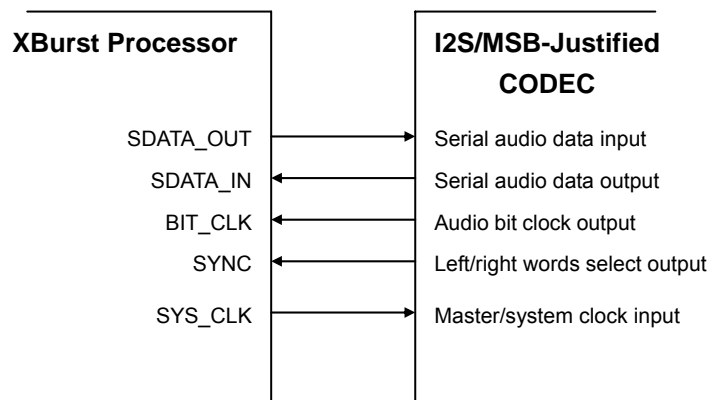

Figure 14-4 Interface to an External Master Mode I2S/MSB-Justified CODEC Diagram

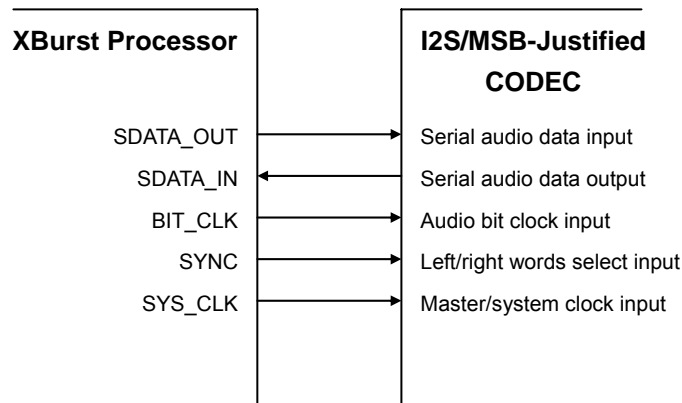

Figure 14-5 Interface to an External Slave Mode I2S/MSB-Justified CODEC Diagram

14.1.4 Signal Descriptions

There are all 5 pins used to connect between AIC and an external audio CODEC device. If an internal CODEC is used, these pins are not needed. They are listed and described in Table 14-1.

Table 14-1 AIC Pins Description

Name	I/O	Description
RESET# SYS_CLK	O	RESET#: AC-link format, active-low CODEC reset. SYS_CLK: I2S/MSB-Justified formats, supply system clock to CODEC.
BIT_CLK	I I/O	12.288 MHz bit-rate clock input for AC-link, and sample rate dependent bit-rate clock input/output for I2S/MSB-Justified.
SYNC	O	48-kHz frame indicator and synchronizer for AC-link format.
	I/O	Indicates the left- or right-channel for I2S/MSB-Justified format.
SDATA_OUT	O	Serial audio output data to CODEC.
SDATA_IN	I	Serial audio input data from CODEC.

14.1.5 RESET# / SYS_CLK Pin

RESET# is AC97 active-low CODEC reset, which outputs to CODEC. The CODEC's registers are reset when this RESET# is asserted. This pin is useful only in AC-link format. If AIC is disabled, it retains the high.

SYS_CLK outputs the system clock to CODEC. This pin is useful only in I2S/MSB-justified format. It generates a frequency between approximately 2.048 MHz and 24.576 MHz by dividing down the PLL clock with a programmable divisor. This frequency can be 256, 384, 512 and etc. times of the audio sampling frequency. Or it can be set to a wanted frequency. If AIC is disabled, it retains the high.

14.1.6 BIT_CLK Pin

BIT_CLK is the serial data bit rate clock, at which AC97/I2S data moves between the CODEC and the processor. One bit of the serial data is transmitted or received each BIT_CLK period. It is fixed to 12.288 MHz in AC-link format, which inputs from the CODEC. In I2S and MSB-justified format it inputs from the CODEC in slave mode and outputs to CODEC in master mode. In the master mode, the clock is generated internally that is 64 times the sampling frequency. Table 14-7 lists the available sampling frequencies based on an internal clock source. If AIC is disabled, AICFR.AUSEL and AICFR.BCKD determine the direction. And it retains the low if it is output and the state is undefined if it is input.

14.1.7 SYNC Pin

In AC-link format, SYNC provides frame synchronization, fixed to 48kHz, by specifying beginning of an audio sample frame and outputs to CODEC. In I2S/MSB-Justified formats, SYNC is used to indicate left- or right-channel sample data and toggled in sample rate frequency. It outputs to CODEC in master mode and inputs from CODEC in slave mode. If AIC is disabled, AICFR.AUSEL and AICFR.BCKD determine the direction. And it retains the low if it is output and the state is undefined if it is input.

14.1.8 SDATA_OUT Pin

SDATA_OUT is AIC output data pin, which outputs serial audio data or data of AC97 CODEC register control to an external audio CODEC device. If AIC is disabled, it retains the low.

14.1.9 SDATA_IN Pin

SDATA_IN is AIC inputs data pin, which inputs serial audio data or data of AC97 CODEC register status from an external audio CODEC device. If AIC is disabled, its state is undefined.

14.2 Register Descriptions

AIC software interface includes 13 registers and 1 FIFO data port. They are mapped in IO memory address space so that program can access them to control the operation of AIC and the outside CODEC.

Table 14-2 AIC Registers Description

Name	Description	RW	Reset value	Address	Size
AICFR	AIC Configuration Register	RW	0x00007800	0x10020000	32
AICCR	AIC Common Control Register	RW	0x00000000	0x10020004	32
ACCR1	AIC AC-link Control Register 1	RW	0x00000000	0x10020008	32
ACCR2	AIC AC-link Control Register 2	RW	0x00000000	0x1002000C	32
I2SCR	AIC I2S/MSB-justified Control Register	RW	0x00000000	0x10020010	32
AICSR	AIC FIFO Status Register	RW	0x00000008	0x10020014	32
ACSR	AIC AC-link Status Register	RW	0x00000000	0x10020018	32
I2SSR	AIC I2S/MSB-justified Status Register	RW	0x00000000	0x1002001C	32
ACCAR	AIC AC97 CODEC Command Address Register	RW	0x00000000	0x10020020	32
ACCDR	AIC AC97 CODEC Command Data Register	RW	0x00000000	0x10020024	32
ACSAR	AIC AC97 CODEC Status Address Register	R	0x00000000	0x10020028	32
ACSDR	AIC AC97 CODEC Status Data Register	R	0x00000000	0x1002002C	32
I2SDIV	AIC I2S/MSB-justified Clock Divider Register	RW	0x00000003	0x10020030	32
AICDR	AIC FIFO Data Port Register	RW	0x????????	0x10020034	32

- 1 AICFR is used to control FIFO threshold, AC-link or I2S/MSB-justified selection, AIC reset, master/slave selection, and AIC enable.
- 2 AICCR is used to control DMA mode, FIFO flush, interrupt enable, internal loop-back, play back and recording enable. It also controls sample size and signed/unsigned data transfer.
- 3 ACCR1 is used to reflect/control valid incoming/outgoing slots of AC97.
- 4 ACCR2 is used to control interrupt enable, output/input sample size, and alternative control of RESET#, SYNC and SDATA_OUT pins in AC-link.
- 5 I2SCR is used to control BIT_CLK stop, audio sample size, I2S or MSB-justified selection in I2S/MSB-justified.
- 6 AICSR is used to reflect FIFOs status.
- 7 ACSR is used to reflect the status of the connected external CODEC in AC-link.
- 8 I2SSR is used to reflect AIC status in I2S/MSB-justified.
- 9 ACCAR and ACCDR are used to hold address and data for AC-link CODEC register read/write.

- 10 ACSAR and ACSDR are used to receive AC-link CODEC registers address and data.
- 11 I2SDIV is used to set clock divider for BIT_CLK generating in I2S/MSB-justified format.
- 12 AICDR is act as data input/output port to/from transmit/receive FIFO when write/read.

14.2.1 AIC Configuration Register (AICFR)

AICFR contains bits to control FIFO threshold, AC-link or I2S/MSB-justified selection, AIC reset, master/slave selection, and AIC enable.

Bits	Name	Description	RW						
31:16	Reserved	Writes to these bits have no effect and always read as 0.	R						
15:12	RFTH	Receive FIFO threshold for interrupt or DMA request. The RFTH valid value is 0 ~ 15. This value represents a threshold value of (RFTH + 1) * 2. When the sample number in receive FIFO, indicated by AICSR.RFL, is great than or equal to the threshold value, AICSR.RFS is set. Larger RFTH value provides lower DMA/interrupt request frequency but have more risk to involve receive FIFO overflow. The optimum value is system dependent.	RW						
11:8	TFTH	Transmit FIFO threshold for interrupt or DMA request. The TFTH valid value 0 ~ 15. This value represents a threshold value of TFTH * 2. When the sample number in transmit FIFO, indicated by AICSR.TFL, is less than or equal to the threshold value, AICSR.TFS is set. Smaller TFTH value provides lower DMA/interrupt request frequency but have more risk to involve transmit FIFO underflow. The optimum value is system dependent.	RW						
7	Reserved	Writes to these bits have no effect and always read as 0.	R						
6	LSMP	Select between play last sample or play ZERO sample in TX FIFO underflow. ZERO sample means sample value is zero. This bit is better to be changed while audio replay is stopped. <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 5px;"> <tr> <th style="width: 20%;">LSMP</th> <th style="width: 80%;">CODEC used</th> </tr> <tr> <td>0</td> <td>Play ZERO sample when TX FIFO underflow</td> </tr> <tr> <td>1</td> <td>Play last sample when TX FIFO underflow</td> </tr> </table>	LSMP	CODEC used	0	Play ZERO sample when TX FIFO underflow	1	Play last sample when TX FIFO underflow	RW
LSMP	CODEC used								
0	Play ZERO sample when TX FIFO underflow								
1	Play last sample when TX FIFO underflow								
5	ICDC	Internal CODEC used. Select between internal or external CODEC. <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 5px;"> <tr> <th style="width: 20%;">ICDC</th> <th style="width: 80%;">CODEC used</th> </tr> <tr> <td>0</td> <td>External CODEC</td> </tr> </table>	ICDC	CODEC used	0	External CODEC	RW		
ICDC	CODEC used								
0	External CODEC								

		1	Internal CODEC	
4	AUSEL	Audio Unit Select. Select between AC-link and I2S/MSB-justified. Change this bit in case of BIT_CLK is stopped (I2SCR.STPBK = 1).		RW
		AUSEL	Selected	
		0	Select AC-link format	
		1	Select I2S/MSB-justified format	
3	RST	Reset AIC. Write 1 to this bit reset AIC registers and FIFOs except AICFR and I2SDIV register. Writing 0 to this bit has no effect and this bit is always reading 0.		W
2	BCKD	BIT_CLK Direction. This bit specifies input/output direction of BIT_CLK. It is only valid in I2S/MSB-justified format. When AC-link format is selected, BIT_CLK is always input and this bit is ignored. Change this bit in case of BIT_CLK is stopped (I2SCR.STPBK = 1).		RW
		BCKD	BIT_CLK Direction	
		0	BIT_CLK is input from an external source	
		1	BIT_CLK is generated internally and driven out to the CODEC	
1	SYNCD	SYNC Direction. This bit specifies input/output direction of SYNC in I2S/MSB-justified format. When AC-link format is selected, SYNC is always output and this bit is ignored. Change this bit in case of BIT_CLK is stopped (I2SCR.STPBK = 1).		RW
		SYNCD	SYNC Direction	
		0	SYNC is input from an external source	
		1	SYNC is generated internally and driven out to the CODEC	
0	ENB	Enable AIC function. This bit is used to enable or disable the AIC function.		RW
		ENB	Description	
		0	Disable AIC Controller	
		1	Enable AIC Controller	

The BCKD bit (bit 2) and SYNCD bit (bit 1) configure the mode of I2S/MSB-justified interface. This is compliant with I2S specification.

BCKD	SYNCD	Description
0 (input)	0 (input)	AIC roles the slave of I2S/MSB-justified interface.
	1 (output)	AIC roles the master with external serial clock source of I2S/MSB-justified interface.
1 (output)	0 (input)	Reserved.
	1 (output)	AIC roles the master of I2S/MSB-justified interface.

14.2.2 AIC Common Control Register (AICCR)

AICCR contains bits to control DMA mode, FIFO flush, interrupt enable, internal loop-back, play back and recording enable. It also controls sample size and signed/unsigned data transfer.

AICCR		0x10020004	
Bit	31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

1	Enabled																

			0	Disabled	
			1	Enabled	
13:12	Reserved	Writes to these bits have no effect and always read as 0.			R
11	M2S	Mono To Stereo. This bit control whether to do mono to stereo sample expansion in play back. When this bit is set, every outgoing sample data in the steam plays in both left and right channels. This bit should only be set in 2 channels configuration. It takes effective immediately when the bit is changed. Change this before replay started.			RW
			M2S	Description	
			0	No mono to stereo expansion	
			1	Do mono to stereo expansion	
10	ENDSW	Endian Switch. This bit control endian change on outgoing 16-bits size audio sample by swapping high and low bytes in the sample data.			RW
			ENDSW	Description	
			0	No change on outgoing sample data	
			1	Swap high and low byte for outgoing 16-bits size sample data	
9	ASVTSU	Audio Sample Value Transfer between Signed and Unsigned data format. This bit is used to control the signed \leftrightarrow unsigned data transfer. If it is 1, the incoming and outgoing audio sample data will be transferred by toggle its most significant bit.			RW
			ASVTSU	Description	
			0	No audio sample value signed \leftrightarrow unsigned transfer	
			1	Do audio sample value signed \leftrightarrow unsigned transfer	
8	FLUSH	FIFO Flush. Write 1 to this bit flush transmit/receive FIFOs to empty. Writing 0 to this bit has no effect and this bit is always reading 0.			W
7	Reserved	Writes to these bits have no effect and always read as 0.			R
6	EROR	Enable ROR Interrupt. This bit is used to control the ROR interrupt enable or disable.			RW
			EROR	ROR Interrupt	
			0	Disabled	
			1	Enabled	
5	ETUR	Enable TUR Interrupt. This bit is used to control the TUR interrupt enable or disable.			RW
			ETUR	TUR Interrupt	
			0	Disabled	
			1	Enabled	
4	ERFS	Enable RFS Interrupt. This bit is used to control the RFS interrupt enable or disable.			RW
			ERFS	RFS Interrupt	
			0	Disabled	
			1	Enabled	

3	ETFS	Enable TFS Interrupt. This bit is used to control the TFS interrupt enable or disable.	RW		
				ETFS	TFS Interrupt
				0	Disabled
		1	Enabled		
2	ENLBF	Enable AIC Loop Back Function. This bit is used to enable or disable the internal loop back function of AIC, which is used for test only. When the AIC loop back function is enabled, normal audio replay/record functions are disabled.	RW		
				ENLBF	Description
				0	AIC Loop Back Function is Disabled
		1	AIC Loop Back Function is Enabled		
1	ERPL	Enable Playing Back function. This bit is used to disable or enable the audio sample data transmitting.	RW		
				ERPL	Description
				0	AIC Playing Back Function is Disabled
		1	AIC Playing Back Function is Enabled		
0	EREC	Enable Recording Function. This bit is used to disable or enable the audio sample data receiving.	RW		
				EREC	Description
				0	AIC Recording Function is Disabled
		1	AIC Recording Function is Enabled		

14.2.3 AIC AC-link Control Register 1 (ACCR1)

ACCR1 contains bits to reflect/control valid incoming/outgoing slots of AC97. It is used only in AC-link format.

Bits	Name	Description	RW
31:26	Reserved	Writes to these bits have no effect and always read as 0.	R
25:16	RS	Receive Valid Slots. These bits are used to indicate which incoming slots are valid. Slot 3 is mapped to bit 16 or RS[0], slot 4 to bit 17 or RS[1] and so on. When write to this field, a bit 1 means we expect a PCM data in the corresponding slot, a bit 0 means the corresponding slot PCM data will be discarded. When read from this field, a bit 1 means we receive an	RW

		expected valid PCM data in the corresponding slot. This field should be written before record started. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>RS[n] Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Slot n+3 is invalid</td> </tr> <tr> <td>1</td> <td>Slot n+3 has valid PCM data</td> </tr> </tbody> </table>	RS[n] Value	Description	0	Slot n+3 is invalid	1	Slot n+3 has valid PCM data	
RS[n] Value	Description								
0	Slot n+3 is invalid								
1	Slot n+3 has valid PCM data								
15:10	Reserved	Writes to these bits have no effect and always read as 0.	R						
9:0	XS	Transmit Valid Slots. These bits making up slots map to the valid bits in the AC'97 tag (slot 0 on SDATA_OUT) and indicate which outgoing slots have valid PCM data. Bit 0 or XS[0] maps to slot 3, bit 1 or XS[1] to slot 4 and so on. Setting the corresponding bit indicates to AIC to take an audio sample from transmit FIFO to fill the respective slot. And it indicates to the CODEC that valid PCM data will be in the respective slot. The number of valid bits will designate how many words will be pulled out of the FIFO per audio frame. This field should be written before record and replay started. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>XS[n] Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Slot n+3 is invalid</td> </tr> <tr> <td>1</td> <td>Slot n+3 has valid PCM data</td> </tr> </tbody> </table>	XS[n] Value	Description	0	Slot n+3 is invalid	1	Slot n+3 has valid PCM data	RW
XS[n] Value	Description								
0	Slot n+3 is invalid								
1	Slot n+3 has valid PCM data								

14.2.4 AIC AC-link Control Register 2 (ACCR2)

ACCR2 contains bits to control interrupt enable, output/input sample size, and alternative control of RESET#, SYNC and SDATA_OUT pins in AC-link. It is valid only in AC-link format.

ACCR2	0x1002000C							
Bit	31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

This bit is used to control the SADR interrupt enable or disable. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>ESADR</th> <th>SADR Interrupt</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Disabled</td> </tr> </tbody> </table>	ESADR	SADR Interrupt	0	Disabled	RW		
ESADR	SADR Interrupt								
0	Disabled								

			1	Enabled	
16	ECADT	Enable CADT Interrupt. This bit is used to control the CADT interrupt enable or disable.			RW
			ECADT	CADT Interrupt	
			0	Disabled	
			1	Enabled	
15:4	Reserved	Writes to these bits have no effect and always read as 0.			R
3	SO	SDATA_OUT output value. When SA is 1, this bit controls SDATA_OUT pin voltage level, 0 for low, 1 for high; otherwise, it is ignored.			RW
2	SR	RESET# pin level. When AC-link is selected, this bit is used to drive the RESET# pin.			RW
			SR	RESET# Pin Voltage Level	
			0	High	
			1	Low	
1	SS	SYNC value. When this bit is read, it returns the actual value of SYNC. When SA is 1, write value controls SYNC pin value. When SA is 0, write to it is ignored.			RW
0	SA	SYNC and SDATA_OUT Alternation. This bit is used to determine the driven signal of SYNC and SDATA_OUT. When SA is 0, SYNC and SDATA_OUT being driven AIC function logic; otherwise, SYNC is controlled by the SS and SDATA_OUT is controlled by the SO. The true table of SYNC is described in following.			RW
			SA	SS	Description
			0	0	When read, indicated SYNC is 0 When write, not effect
				1	When read, indicated SYNC is 1 When write, not effect
			1	0	When read, indicated SYNC is 0 When write, SYNC is driven to 0
				1	When read, indicated SYNC is 1 When write, SYNC is driven to 1

14.2.5 AIC I2S/MSB-justified Control Register (I2SCR)

I2SCR contains bits to control BIT_CLK stop, audio sample size, I2S or MSB-justified selection in I2S/MSB-justified. It is valid only in I2S/MSB-justified format.

Bits	Name	Description	RW						
31:13	Reserved	Writes to these bits have no effect and always read as 0.	R						
12	STPBK	Stop BIT_CLK. It is used to stop the BIT_CLK in I2S/MSB-justified format. When AC-link is selected, all of its operations are ignored. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>STPBK</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>BIT_CLK is not stopped</td> </tr> <tr> <td>1</td> <td>BIT_CLK is stopped</td> </tr> </tbody> </table> <p>Please set this bit to 1 to stop BIT_CLK when change AICFR.AUSEL and AICFR.BCKD.</p>	STPBK	Description	0	BIT_CLK is not stopped	1	BIT_CLK is stopped	RW
STPBK	Description								
0	BIT_CLK is not stopped								
1	BIT_CLK is stopped								
11:5	Reserved	Writes to these bits have no effect and always read as 0.	R						
4	ESCLK	Enable SYSCLK output. When this bit is 1, the SYSCLK outputs to chip outside is enabled. Else, the clock is disabled.	RW						
0	AMSL	Specify Alternate Mode (I2S or MSB-Justified) Operation. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>AMSL</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Select I2S Operation Mode</td> </tr> <tr> <td>1</td> <td>Select MSB-Justified Operation Mode</td> </tr> </tbody> </table>	AMSL	Description	0	Select I2S Operation Mode	1	Select MSB-Justified Operation Mode	RW
AMSL	Description								
0	Select I2S Operation Mode								
1	Select MSB-Justified Operation Mode								

14.2.6 AIC Controller FIFO Status Register (AICSR)

AICSR contains bits to reflect FIFOs status. Most of the bits are read-only except two, which can be written a 0.

Bits	Name	Description	RW								
31:30	Reserved	Writes to these bits have no effect and always read as 0.	R								
29:24	RFL	Receive FIFO Level. The bits indicate the amount of valid PCM data in Receive FIFO. <table border="1" data-bbox="533 398 1233 528"> <thead> <tr> <th>RFL Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0x00 ~ 0x20</td> <td>RFL valid PCM data in receive FIFO</td> </tr> <tr> <td>0x21 ~ 0x3F</td> <td>Reserved</td> </tr> </tbody> </table>	RFL Value	Description	0x00 ~ 0x20	RFL valid PCM data in receive FIFO	0x21 ~ 0x3F	Reserved	R		
RFL Value	Description										
0x00 ~ 0x20	RFL valid PCM data in receive FIFO										
0x21 ~ 0x3F	Reserved										
23:14	Reserved	Writes to these bits have no effect and always read as 0.	R								
13:8	TFL	Transmit FIFO Level. The bits indicate the amount of valid PCM data in Transmit FIFO. <table border="1" data-bbox="533 658 1233 788"> <thead> <tr> <th>TFL Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0x00 ~ 0x20</td> <td>TFL valid PCM data in transmit FIFO</td> </tr> <tr> <td>0x21 ~ 0x3F</td> <td>Reserved</td> </tr> </tbody> </table>	TFL Value	Description	0x00 ~ 0x20	TFL valid PCM data in transmit FIFO	0x21 ~ 0x3F	Reserved	R		
TFL Value	Description										
0x00 ~ 0x20	TFL valid PCM data in transmit FIFO										
0x21 ~ 0x3F	Reserved										
7	Reserved	Writes to these bits have no effect and always read as 0.	R								
6	ROR	Receive FIFO Over Run. This bit indicates that receive FIFO has or has not experienced an overrun. <table border="1" data-bbox="485 913 1281 1171"> <thead> <tr> <th>ROR</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td rowspan="2">0</td> <td>When read, indicates over-run has not been found</td> </tr> <tr> <td>When write, clear itself</td> </tr> <tr> <td rowspan="2">1</td> <td>When read, indicates data has even been written to full receive FIFO</td> </tr> <tr> <td>When write, not effects</td> </tr> </tbody> </table>	ROR	Description	0	When read, indicates over-run has not been found	When write, clear itself	1	When read, indicates data has even been written to full receive FIFO	When write, not effects	RW
ROR	Description										
0	When read, indicates over-run has not been found										
	When write, clear itself										
1	When read, indicates data has even been written to full receive FIFO										
	When write, not effects										
5	TUR	Transmit FIFO Under Run. This bit indicates that transmit FIFO has or has not experienced an under-run. <table border="1" data-bbox="485 1256 1281 1514"> <thead> <tr> <th>TUR</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td rowspan="2">0</td> <td>When read, indicates under-run has not been found</td> </tr> <tr> <td>When write, clear itself</td> </tr> <tr> <td rowspan="2">1</td> <td>When read, indicates data has even been read from empty transmit FIFO</td> </tr> <tr> <td>When write, not effects</td> </tr> </tbody> </table>	TUR	Description	0	When read, indicates under-run has not been found	When write, clear itself	1	When read, indicates data has even been read from empty transmit FIFO	When write, not effects	RW
TUR	Description										
0	When read, indicates under-run has not been found										
	When write, clear itself										
1	When read, indicates data has even been read from empty transmit FIFO										
	When write, not effects										
4	RFS	Receive FIFO Service Request. This bit indicates that receive FIFO level is or not below RFL threshold which is controlled by AICFR.RFTH. When RFS is 1, it may trigger interrupt or DMA request depends on the interrupt enable and DMA setting. <table border="1" data-bbox="533 1680 1233 1809"> <thead> <tr> <th>RFS</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Receive FIFO level below RFL threshold</td> </tr> <tr> <td>1</td> <td>Receive FIFO level at or above RFL threshold</td> </tr> </tbody> </table>	RFS	Description	0	Receive FIFO level below RFL threshold	1	Receive FIFO level at or above RFL threshold	R		
RFS	Description										
0	Receive FIFO level below RFL threshold										
1	Receive FIFO level at or above RFL threshold										
3	TFS	Transmit FIFO Service Request. This bit indicates that transmit FIFO level exceeds TFL threshold which is controlled by AICFR.TFTH When TFS is 1, it may trigger interrupt or DMA request depends on the interrupt enable and DMA setting. <table border="1" data-bbox="533 1977 1233 2016"> <thead> <tr> <th>TFS</th> <th>Description</th> </tr> </thead> <tbody> </tbody> </table>	TFS	Description	R						
TFS	Description										

		0	Transmit FIFO level exceeds TFL threshold		
		1	Transmit FIFO level at or below TFL threshold		
2:0	Reserved	Writes to these bits have no effect and always read as 0.			R

14.2.7 AIC AC-link Status Register (ACSR)

ACSR contains bits to reflect the status of the connected external CODEC in AC-link format. Bits in this register are read-only in general, except some of them can be written a 0.

ACSR **0x10020018**

Bit 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reserved											SLTERR	CRDY	CLPM	RSTO	SADR	CADT	Reserved										
----------	--	--	--	--	--	--	--	--	--	--	--------	------	------	------	------	------	----------	--	--	--	--	--	--	--	--	--	--

RST 0

Bits	Name	Description	RW						
31:22	Reserved	Writes to these bits have no effect and always read as 0.	R						
21	SLTERR	Hardware detects a Slot Error. This bit indicates an error in SLOTREQ bits on incoming data from external CODEC is detected. The error can be: (1) find 1 in a SLOTREQ bit, which corresponding to an inactive slot; (2) all active slots should be request in the same time by SLOTREQ, but an exception is found. All errors are accumulated to ACSR.SLTERR by hardware until software clears it. Software writes 0 clear this bit and write 1 has no effect.	RW						
20	CRDY	External CODEC Ready. This bit is derived from the CODEC Ready bit of Slot 0 in SDATA_IN, and it indicates the external AC97 CODEC is ready or not. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>CRDY</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>CODEC is not ready</td> </tr> <tr> <td>1</td> <td>CODEC is ready</td> </tr> </tbody> </table>	CRDY	Description	0	CODEC is not ready	1	CODEC is ready	R
CRDY	Description								
0	CODEC is not ready								
1	CODEC is ready								
19	CLPM	External CODEC Low Power Mode. This bit indicates the external CODEC is switched to low power mode or BIT_CLK is active from CODEC after wake up. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>CLPM</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>BIT_CLK is active</td> </tr> <tr> <td>1</td> <td>CODEC is switched to low power mode</td> </tr> </tbody> </table>	CLPM	Description	0	BIT_CLK is active	1	CODEC is switched to low power mode	R
CLPM	Description								
0	BIT_CLK is active								
1	CODEC is switched to low power mode								
18	RSTO	External CODEC Registers Read Status Time Out. This bit indicates that the read status time out is detected or not. It is set to 1 if the data not return in 4 frames after a CODEC registers read command issued. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>RSTO</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>When read, indicates time out has not occurred</td> </tr> </tbody> </table>	RSTO	Description	0	When read, indicates time out has not occurred	RW		
RSTO	Description								
0	When read, indicates time out has not occurred								

		<table border="1"> <tr> <td>1</td> <td>When read, indicates read status time out found</td> </tr> </table> <p>Write 0 clear this bit and write 1 is ignored. When RSTO is 1, it may trigger an interrupt depends on the interrupt enable setting.</p>	1	When read, indicates read status time out found					
1	When read, indicates read status time out found								
17	SADR	<p>External CODEC Registers Status Address and Data Received. This bit indicates that address and data of an external AC '97 CODEC register has or has not been received.</p> <table border="1"> <thead> <tr> <th>SADR</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>When read, indicates no register address/data received</td> </tr> <tr> <td>1</td> <td>When read, indicates address/data received</td> </tr> </tbody> </table> <p>Write 0 clear this bit and write 1 is ignored. SADR	Description								
0	When read, indicates no register address/data received								
1	When read, indicates address/data received								
16	CADT	<p>Command Address and Data Transmitted. This bit indicates that a CODEC register reading/writing command transmission has completed or not.</p> <table border="1"> <thead> <tr> <th>CADT</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>When read, indicates the command has not done</td> </tr> <tr> <td>1</td> <td>When read, indicates the command has done</td> </tr> </tbody> </table> <p>Write 0 clear this bit and write 1 is ignored. When CADT is 1, it may trigger an interrupt depends on the interrupt enable setting.</p>	CADT	Description	0	When read, indicates the command has not done	1	When read, indicates the command has done	RW
CADT	Description								
0	When read, indicates the command has not done								
1	When read, indicates the command has done								
15:0	Reserved	Writes to these bits have no effect and always read as 0.	R						

14.2.8 AIC I2S/MSB-justified Status Register (I2SSR)

I2SSR is used to reflect AIC status in I2S/MSB-justified. It is a read-only register.

Bits	Name	Description	RW						
31:3	Reserved	Writes to these bits have no effect and always read as 0.	R						
2	BSY	<p>AIC busy in I2S/MSB-justified format.</p> <table border="1"> <thead> <tr> <th>BSY</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>AIC controller is idle or disabled</td> </tr> <tr> <td>1</td> <td>AIC controller currently is transmitting or receiving a frame</td> </tr> </tbody> </table>	BSY	Description	0	AIC controller is idle or disabled	1	AIC controller currently is transmitting or receiving a frame	R
BSY	Description								
0	AIC controller is idle or disabled								
1	AIC controller currently is transmitting or receiving a frame								
1:0	Reserved	Writes to these bits have no effect and always read as 0.	R						

14.2.9 AIC AC97 CODEC Command Address & Data Register (ACCAR, ACCDR)

ACCAR and ACCDR are used to hold register address and data for external AC-link CODEC register read/write operation through SDATA_OUT. The format of ACCAR.CAR and ACCDR.CDR is compliant with AC'97 Component Specification 2.3 where ACCAR.CAR[19] of "1" specifies CODEC register read operation, of "0" specifies CODEC register write operation. The write access to ACCAR and ACCDR signals AIC to issue this operation. Please reference to 0 for software flow. These registers are valid only in AC-link. It is ignored in I2S/MSB-justified format.

Bits	Name	Description	RW
31:20	Reserved	Writes to these bits have no effect and always read as 0.	R
19:0	CAR	Command Address Register. This is used to hold 20-bit AC '97 CODEC register address transmitted in SDATA_OUT slot 1. After this field is write, it should not be write again until the operation is finished.	RW

Bits	Name	Description	RW
31:20	Reserved	Writes to these bits have no effect and always read as 0.	R
19:0	CDR	Command Data Register. This is used to hold 20-bit AC'97 CODEC register data transmitted in SDATA_OUT slot 2. After this field is write, it should not be write again until the operation is finished.	RW

14.2.10 AIC AC97 CODEC Status Address & Data Register (ACSAR, ACSDR)

ACSAR and ACSDR are used to receive the external AC-link CODEC registers address and data from SDATA_IN. When AIC receives CODEC register status from SDATA_IN, it set ACSR.SADR bit and put the address and data to ACSAR.SAR and ACSDR.SDR. Please reference to 0 for software flow. These registers are valid only in AC-link format and are ignored in I2S/MSB-justified format.

ACSAR

0x10020028

Bits	Name	Description	RW
31:20	Reserved	Writes to these bits have no effect and always read as 0.	R
19:0	SAR	CODEC Status Address Register. This is used to receive 20-bit AC '97 CODEC status address from SDATA_IN slot 1. Which reflect the register index for which data is being returned. The write operation is ignored.	R

ACSDR

0x1002002C

Bits	Name	Description	RW
31:20	Reserved	Writes to these bits have no effect and always read as 0.	R
19:0	SDR	CODEC Status Data Register. This is used to receive 20-bit AC '97 CODEC status data from SDATA_IN slot 2. The register data of external CODEC is returned. The write operation is ignored.	R

14.2.11 AIC I2S/MSB-justified Clock Divider Register (I2SDIV)

I2SDIV is used to set clock divider to generated BIT_CLK from SYS_CLK in I2S/MSB-justified format.

I2SDIV

0x10020030

Bits	Name	Description	RW
31:4	Reserved	Writes to these bits have no effect and always read as 0.	R
3:0	DV	Audio BIT_CLK clock divider value minus 1. I2SDIV.DV is used to control the generating of BIT_CLK from dividing SYS_CLK. The dividing value should be even and I2SDIV.DV should be set to the dividing value minus	RW

		1. So I2SDIV.DV bit0 is fixed to 1. BIT_CLK frequency is fixed to $64 f_s$ in AIC, where f_s is the audio sample frequency. I2SDIV.DV depends on SYS_CLK frequency f_{SYS_CLK} , which is selected according to external CODEC's requirement and internal PLL frequency. Please reference to 14.4.9 "Serial Audio Clocks and Sampling Frequencies" for further description.	
--	--	--	--

14.2.12 AIC FIFO Data Port Register (AICDR)

AICDR is act as data input port to transmit FIFO when write and data output port from receive FIFO when read, one audio sample every time. The FIFO width is 24 bits. Audio sample with size N that is less than 24 is located in LSB N-bits. The sample size is specified by ACCR2.OASS and ACCR2.IASS in AC-link, and by I2SCR.WL in I2S/MSB-justified. The sample order is specified by ACCR1.XS and ACCR1.RS in AC-link. In I2S/MSB-justified, the left channel sample is prior to the right channel sample.

Care should be taken to monitor the status register to insure that there is room for data in the FIFO when executing a program read or write transaction. This is taken care automatically in DMA.

Bits	Name	Description	RW
31:24	Reserved	Writes to these bits have no effect and always read as 0.	R
23:0	DATA	FIFO port. When write to it, data is push to the transmit FIFO. When read from it, data is pop from the receiving FIFO.	RW

14.3 Serial Interface Protocol

14.3.1 AC-link serial data format

Following figures are AC-link serial data format. Audio data is MSB adjusted, regardless of 8, 16, 18, 20, 24 bits sample size. When a 24-bits sample is transmitted, the LSB 4-bits are truncated. When to record 24-bits sample, 4-bits of 0 are appended in LSB. Please reference to “AC '97 Component Specification Revision 2.3, 2002”, provided by Intel Corporation, for details of AC '97 architecture and AC-link specification.

Figure 14-6 AC-link audio frame format

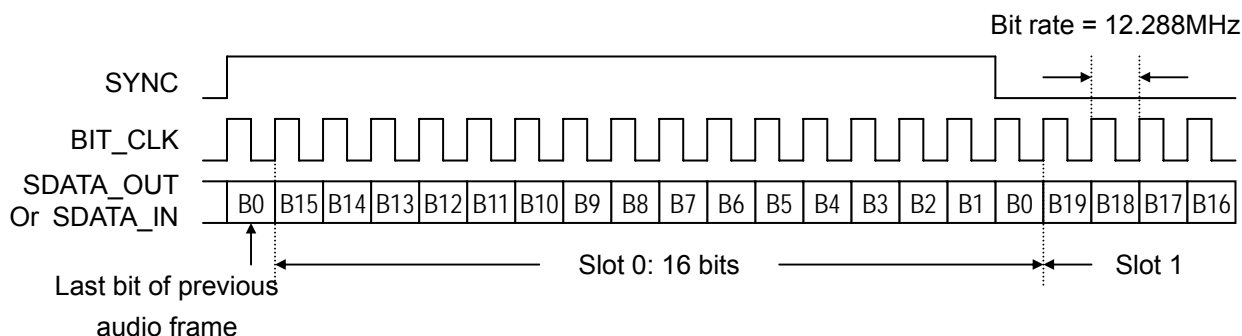

Figure 14-7 AC-link tag phase, slot 0 format

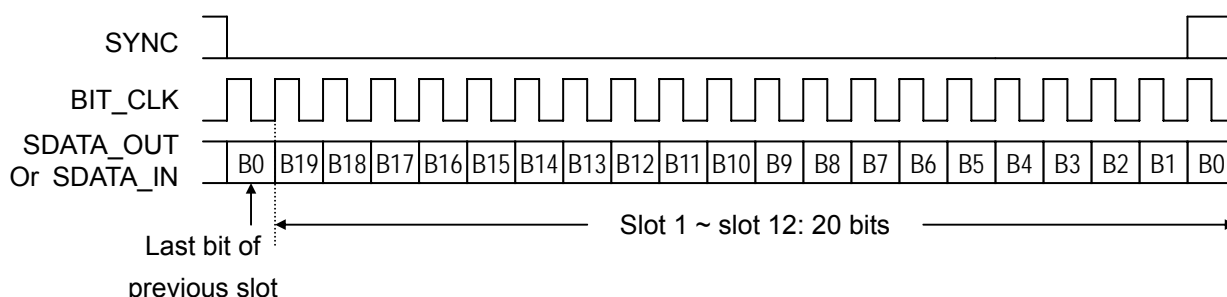

Figure 14-8 AC-link data phases, slot 1 ~ slot 12 format

14.3.2 I2S and MSB-justified serial audio format

Normal I2S and MSB-justified are similar protocols for digitized stereo audio transmitted over a serial path.

The BIT_CLK supplies the serial audio bit rate, the basis for the external CODEC bit-sampling logic. Its frequency is 64 times the audio sampling frequency. Divided by 64, the resulting 8 kHz to 48 kHz or even higher signal signifies timing for left and right serial data samples passing on the serial data paths. This left/right signal is sent to the CODEC on the SYNC pin. Each phase of the left/right signal is accompanied by one serial audio data sample on the data pins SDATA_IN and SDATA_OUT.

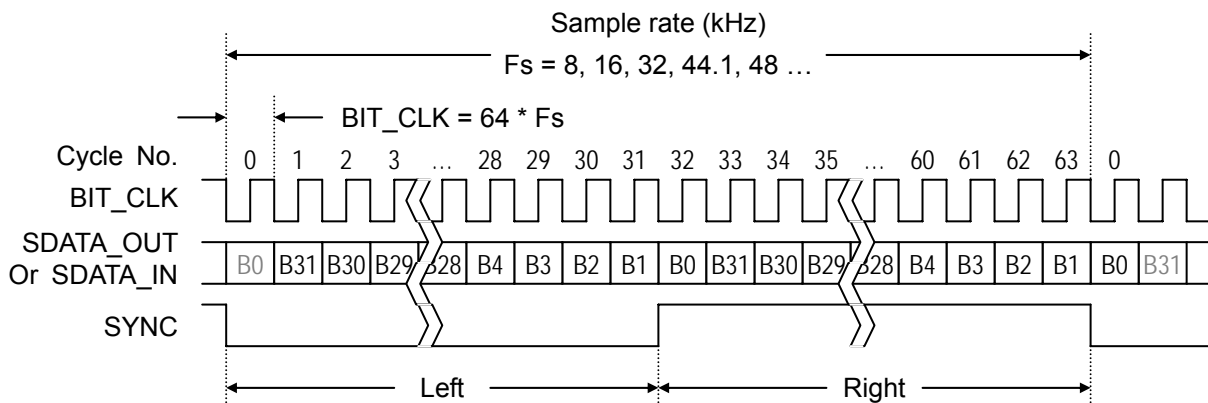

Figure 14-9 I2S data format

Figure 14-10 MSB-justified data format

Figure 14-9 and Figure 14-10 provide timing diagrams that show formats for the normal I2S and MSB-justified modes of operations. Data is sampled on the rising edge of the BIT_CLK and data is sent out on the falling edge of the BIT_CLK.

Data is transmitted and received in frames of 64 BIT_CLK cycles. Each frame consists of a left sample

and a right sample. Each sample holds 8, 16, 18, 20 or 24 bits of valid data. The LSB other bits of each sample is padded with zeroes.

In the normal I2S mode, the SYNC is low for the left sample and high for the right sample. Also, the MSB of each data sample lags behind the SYNC edges by one BIT_CLK cycle.

In the MSB-justified mode, the SYNC is high for the left sample and low for the right sample. Also, the MSB of each data sample is aligned with the SYNC edges.

When use with the internal CODEC, the BIT_CLK and SYNC signals are provided by the internal CODEC from the 12MHz clock.

14.3.3 Audio sample data placement in SDATA_IN/SDATA_OUT

The placement of audio sample in incoming/outgoing serial data stream for all formats support in AIC is MSB (Most Significant Bit) justified. Suppose n bit sample composed by

Table 14-3 described the how sample data bits are transferred.

Table 14-3 Sample data bit relate to SDATA_IN/SDATA_OUT bit

14.4 Operation

The AIC can be accessed either by the processor using programmed I/O instructions or by the DMA controller. The processor uses programmed I/O instructions to access the AIC and can access the following types of data:

- The AIC memory mapped registers data—All registers are 32 bits wide and are aligned to word boundaries.
- AIC controller FIFO data—An entry is placed into the transmit FIFO by writing to the I2S controller's Serial Audio Data register (AICDR). Writing to AICDR updates a transmit FIFO entry. Reading AICDR flushes out a receive FIFO entry.
- The external CODEC registers for I2S CODEC—CODEC registers can be accessed through the L3 bus. The L3 bus operation is emulated by software controlling three GPIO pins.
- The external CODEC registers for AC97 CODEC—An AC97 audio CODEC can contain up to sixty-four 16-bit registers. A CODEC uses a 16-bit address boundary for registers. The AIC supplies access to the CODEC registers through several registers.
- The internal CODEC registers can be accessed via memory mapped registers in the CODEC.

The DMA controller can only access the FIFOs. Accesses are made through the data registers, as explained in the previous paragraph. The DMA controller responds to the following DMA requests made by the I2S controller:

- The transmit FIFO request is based on the transmit trigger-threshold (AICFR.TFTH) setting. See 14.2.1 for further details regarding AICFR.TFTH.
- The receive FIFO request is based on the receive trigger-threshold (AICFR.RFTH) setting. See 14.2.1 for further details regarding AICFR.RFTH.

Before operation to AIC, you may need to set proper PIN function selection from GPIO using if the pin is shared with GPIO.

Please also reference to “AC '97 Component Specification Revision 2.3, 2002” when deal with AIC AC-link operations.

14.4.1 Initialization

At power-on or other hardware reset (WDT and etc), AIC is disabled. Software must initiate AIC and the internal or external CODEC after power-on or reset. If errors found in data transferring, or in other places, software must initial AIC and optional, the internal or external CODEC. Here is the initial flow.

- 1 Select internal or external CODEC (AICFR.ICDC).
- 2 If external CODEC is selected, select AC-link or I2S/MSB-Justified (AICFR.AUSEL). If internal CODEC is used, select I2S/MSB-Justified format (AICFR.AUSEL=1). If the resettlement without involving link format and architecture changing, this step can be skip.
- 3 If I2S/MSB-Justified is selected, select between I2S and MSB-Justified (I2SCR.AMSL), decide BIT_CLK direction (AICFR.BCKD) and SYNC direction (AICFR.SYNCD). If BIT_CLK is configured as output, BIT_CLK divider I2SDIV.DV must be set to what correspond with the

values as shown in Table 14-7. And the clock selection and the divider between PLL clock out and AIC also must be set (CFCR.I2S and I2SCDR in CPM). If internal CODEC is used, select 12MHz clock input (via set proper value in CFR.I2S and I2SCDR), I2S format (I2SCR.AMSL=0), input BIT_CLK (AICFR.BCKD=0), input SYNC (AICFR.SYNCD=0).

- 4 Enable AIC by write 1 to AICFR.ENB.
- 5 If it needs to reset AIC registers and flush FIFOs, write 1 to AICFR.RST. If it need only flush FIFOs, write 1 to ACCR.FLUSH. BIT_CLK must exist here and after.
- 6 In AC-link format, issue a warm or cold CODEC reset.
- 7 In AC-link format, configure AC '97 CODEC via ACCAR and ACCDR registers. If the resettlement doesn't involving AC'97 CODEC registers changing, this step can be skip.
- 8 In case of external CODEC with I2S/MSB-Justified format, configure I2S/MSB-justified CODEC via the control bus connected to the CODEC, for instance I2C or L3, depends on CODEC. In case of internal CODEC, configure CODEC via CODEC's memory mapped registers. If the resettlement without involving I2S/MSB-justified CODEC or ADC/DAC function changing, this step can be skip.

14.4.2 AC '97 CODEC Power Down

AC '97 CODEC can be placed in a low power mode. When the CODEC's power-down register (26h), is programmed to the appropriate value, the CODEC will be put in a low power mode and both BIT_CLK and SDATA_IN will be brought to and held at a logic low voltage level.

Once powered down, re-activation of the AC-link via re-assertion of the SYNC signal must not occur for a minimum of four audio frame times following the frame in which the power down was triggered. When AC-link powers up it indicates readiness via the CODEC Ready bit (input slot 0, bit 15).

14.4.3 Cold and Warm AC '97 CODEC Reset

AC-link reset operations occur when the system is initially powered up, when resuming from a lower powered sleep state, and in response to critical subsystem failures that can only be recovered from with a reset.

14.4.3.1 Cold AC '97 CODEC Reset

A cold reset is achieved by asserting RESET# for the minimum specified time. By driving RESET# low, BIT_CLK, and SDATA_IN will be activated, or re-activated as the case may be, and all AC '97 CODEC registers will be initialized to their default power on reset values.

RESET# is an asynchronous AC '97 CODEC input.

Figure 14-11 Cold AC '97 CODEC Reset Timing

Table 14-4 Cold AC '97 CODEC Reset Timing parameters

Parameter	Symbol	Min	Type	Max	Units
RESET# active low pulse width	T_{rst_low}	1.0	-	-	μs
RESET# inactive to BIT_CLK startup delay	$T_{rst2clk}$	162.8	-	-	ns

14.4.3.2 Warm AC '97 CODEC Reset

A warm AC'97 reset will re-activate the AC-link without altering the current AC'97 register values. Driving SYNC high for a minimum of 1 μs in the absence of BIT_CLK signals a warm reset.

Within normal audio frames SYNC is a synchronous AC '97 CODEC input. However, in the absence of BIT_CLK, SYNC is treated as an asynchronous input used in the generation of a warm reset to AC '97 CODEC.

Figure 14-12 Warm AC '97 CODEC Reset Timing

Table 14-5 Warm AC '97 CODEC Reset Timing Parameters

Parameter	Symbol	Min	Type	Max	Units
SYNC active high pulse width	T_{sync_high}	1.0	-	-	μs
SYNC inactive to BIT_CLK startup delay	$T_{sync2clk}$	162.8	-	-	ns

14.4.4 External CODEC Registers Access Operation

The external audio CODEC can be configured/controlled by its internal registers. To access these registers, an I2S/MSB-justified CODEC usually employs L3 bus, SPI bus, I2C bus or other control bus. The L3 bus operation can be emulated by software controlling 3 GPIO pins of the chip. For AC '97, "AC '97 Component Specification" defines the CODEC register access protocol. Several registers are provided in AIC to accomplish this task.

The ACCAR and ACCDR are used to send a register accessing request command to external AC '97 CODEC. The ACSAR and ACSDR are used to receive a register's content from external AC'97 CODEC. The register accessing request and the register's content returning is asynchronous.

The AC'97 CODEC register accessing request flow:

- 1 If ACSR.CADT is 0, wait for 25.4 μ s. If no previous accessing request, this step can be skipped.
- 2 Clear ACSR.CADT.
- 3 If read access, write read-command and register address to ACCAR, if write access, write write-command and register address to ACCAR and write data to ACCDR. Any order of write ACCAR and ACCDR is OK.
- 4 Polling for ACSR.CADT changing to 1, which means the request has been send to CODEC via AC-link.

The AC'97 CODEC register content receiving flow by polling:

- 1 Polling for ACSR.SADR changing to 1.
- 2 Read the CODEC register's address from ACSAR and content from ACSDR.
- 3 Clear ACSR.SADR.

The AC'97 CODEC register content receiving flow by interrupt:

- 1 Before accessing request, clear ACSR.SADR and set ACCR2.ESADR.
- 2 Waiting for the interrupt. When the interrupt is found, check if ACSR.SADR is 1, if not, repeat this step again.
- 3 Read the CODEC register's address from ACSAR and content from ACSDR.
- 4 Clear ACSR.SADR.

14.4.5 Audio Replay

Outgoing audio sample data (from AIC to CODEC) is written to AIC transmit FIFO from processor via store instruction or from memory via DMA. AIC then takes the data from the FIFO, serializes it, and sends it over the serial wire SDATA_OUT to an external CODEC or over an internal wire to an internal CODEC.

The audio transmission is enabled automatically when the AIC is enabled by set AICFR.ENB. But all replay data is zero at this time except both of the following conditions are true:

- 1 AICCR.ERPL must be 1. If AICCR.ERPL is 0, value of zero is sent to CODEC even if there are

samples in transmit FIFO.

- 2 At least one audio sample data in the transmit FIFO. If the transmit FIFO is empty, value of zero or last sample depends on AICFR.LSMP, is send to CODEC even if AICCR.ERPL is 1.

Here is the audio replay flow:

- 1 Configure the CODEC as needed.
- 2 Configure sample size by AICCR.OSS.
- 3 Configure sample rate by clock dividers (for I2S/MSB-Justified format with BIT_CLK is provided internally) or by CODEC registers (for AC-link or BIT_CLK provided by external CODEC) or by CODEC memory mapped registers (for internal CODEC).
- 4 For AC-link, configure replay channels by ACCR1.XS.
- 5 Some other configurations: mono to stereo, endian switch, signed/unsigned data transfer, transmit FIFO configuration, play ZERO or last sample when TX FIFO under-run, and etc.
- 6 Write 1 to AICCR.ERPL. It is suggested that at least a frame of PCM data is pre-filled in the transmit FIFO to prevent FIFO under-run flag (AICSR.TUR).
- 7 Fill sample data to the transmit FIFO. Repeat this till finish all sample data. In this procedure, please control the FIFO to make sure no FIFO under-run and other errors happen. When the transmit FIFO under-run, noise or pause may be heard in the audio replay, AICSR.TUR is 1, and if AICCR.ETUR is 1, AIC issues an interrupt. Please reference to 14.4.7 for detail description on FIFO.
- 8 Waiting for AICSR.TFL change to 0. So that all samples in the transmit FIFO has been replayed, then we can have a clean start up next time.
- 9 Write 0 to AICCR.ERPL.

14.4.6 Audio Record

Incoming audio sample data (from CODEC to AIC) is received from SDATA_IN (for an external CODEC) or an internal wire (for an internal CODEC) serially and converted to parallel word and stored in AIC receive FIFO. Then the data can be taken from the FIFO to processor via load instruction or to memory via DMA.

The audio recording is enabled automatically when the AIC is enabled by set AICFR.ENB. But all received data is discarded at this time except both of the following conditions are true:

- 1 AICCR.EREC must be 1. If AICCR.EREC is 0, the received data is discarded even if there are rooms in the receive FIFO.
- 2 At least one room left in the receive FIFO. If the receive FIFO is full, the received data is discarded even if AICCR.EREC is 1.

Here is the audio record flow:

- 1 Configure the CODEC as needed.
- 2 Configure sample size by AICCR.ISS.
- 3 Configure sample rate by clock dividers (for I2S/MSB-Justified format with BIT_CLK is provided internally) or by CODEC registers (for AC-link or BIT_CLK provided by external

- CODEC) or by CODEC memory mapped registers (for internal CODEC).
- 4 Some other configurations: signed/unsigned data transfer, receive FIFO configuration, and etc.
 - 5 Write 1 to AICCR.EREC. Make sure there are rooms available in the receive FIFO before set AICCR.EREC. Usually, it should empty the receive FIFO by fetch data from it before set AICCR.EREC.
 - 6 Take sample data form the receive FIFO. Repeat this till the audio finished. In this procedure, please control the FIFO to make sure no FIFO over-run and other errors happen. When the receive FIFO over-run, same recorded audio samples will be lost, AICSR.ROR is 1, and if AICCR.EROR is 1, AIC issues an interrupt. Please reference to 14.4.7 for detail description on FIFO. For AC-link, ACCR1.RS tells which channels are recorded.
 - 7 Write 0 to AICCR.EREC.
 - 8 Take sample data from the receive FIFO until AICSR.RFL change to 0. So that all samples in the receive FIFO has been taken away, then we can have a clean start up next time. When the receive FIFO is empty, read from it returns zero.

14.4.7 FIFOs operation

AIC has two FIFOs, one for transmit audio sample and one for receive. All AIC played/recorded audio sample data is taken from/send to transmit/receive FIFOs. The FIFOs are in 24 bits width and 32 entries depth, one entry for keep one audio sample regardless of the sample size. AICDR.DATA provides the access point for processor/DMA to write to transmit FIFO and read from receive FIFO. One time access to AICDR.DATA process one sample. The sample data should be put in LSB (Least Significant Bit) in memory or processor registers. For transmitting, bits exceed sample are discarded. For receiving, these bits are set to 0. Figure 14-13 illustrates the FIFOs access.

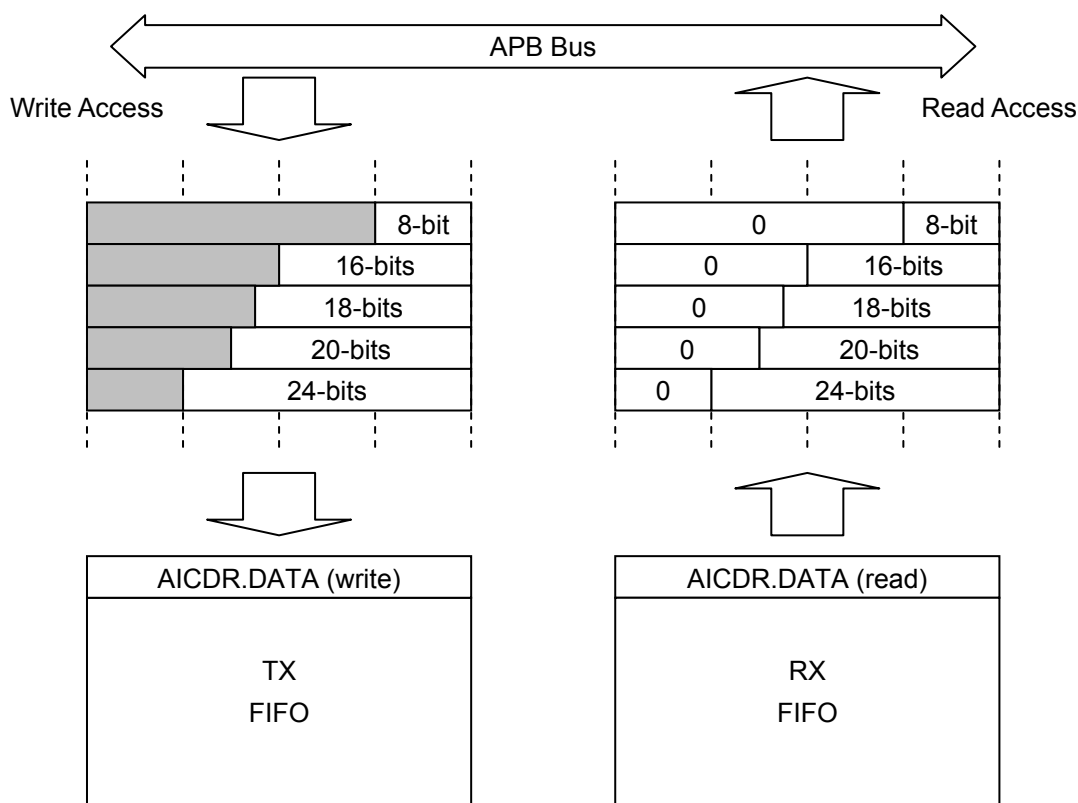

Figure 14-13 Transmitting/Receiving FIFO access via APB Bus

The software and bus initiator must guarantee the right sample placement at the bus.

In case of DMA bus initiator, one 24, 20, 18 bits audio sample must occupies one 32-bits word in memory, so 32-bits width DMA must be used. One 16 bits sample occupies one 16-bits half word in memory, so 16-bits width DMA must be used. One 8-bits sample occupies one byte in memory, and use 8-bits width DMA.

In case of processor bus initiator, any type of the audio sample must occupy one CPU general-purpose register at LSB, and read/write from/to AICDR.DATA with 32-bits load/store instruction. When process small sample size, 16-bits or 8-bits, software may need to do the data

pack/unpack.

The AICFR.TFTH and AICFR.RFTH are used to set the FIFO level thresholds, which are the trig levels of DMA request and/or FIFO service interrupt. The AICFR.TFTH and AICFR.RFTH should be set to proper values, too small or too big are not good. When it is too small, the DMA burst length or the number of sample can be processed by processor is too small, which harms the bus or processor efficiency. When it is too big, the bus or the interrupt latency left for under-run/over-run is too small, which may causes replay/record errors.

AICSR.TUR is set to 1 during transmit under-run conditions. If AICCR.ETUR is 1, this can trigger an interrupt. During transmit under-run conditions, zero or last sample is continuously sent out across the serial link. Transmit under-run can occur under the following conditions:

- 1 Valid transmit data is still available in memory, but the DMA controller/processor starves the transmit FIFO, as it is busy servicing other higher-priority tasks.
- 2 The DMA controller/processor has transferred all valid data from memory to the transmit FIFO.

AICSR.ROR is set to 1 during receive over-run conditions. If AICCR.EROR is 1, this can trigger an interrupt. During receive over-run conditions, data sent by the CODEC is lost and is not recorded.

When replay/record two channels data, the left channel is always the first data in FIFOs and in the serial link. If multiple channels in AC-link are used, the channel sample order is follows the slot order.

14.4.8 Data Flow Control

There are three approaches provided to control/synchronize the audio incoming/outgoing data flow.

14.4.8.1 Polling and Processor Access

AICSR.RFL and AICSR.TFL reflect how many samples exist in receiving and transmitting FIFOs. Through read these register fields, processor can detect when there are samples in receiving FIFO in audio record and then load them from the RX-FIFO, and when there are rooms in transmitting FIFO in audio replay and then store samples to the TX-FIFO.

Polling approach is in very low efficiency and is not recommended.

14.4.8.2 Interrupt and Processor Access

Set proper values to AICFR.TFTH and AICFR.RFTH, the FIFO interrupts trig thresholds. Set AICCR.ETFS and/or AICCR.ERFS to 1 to enable transmitting and/or receiving FIFO level trigger interrupts. When the interrupt found, it means there are rooms or samples in the TX or RX FIFO, and processor can store or load samples to or from the FIFO.

Interrupt approach is more efficient than polling approach.

14.4.8.3 DMA Access

Audio data is real time stream, though it is in low data bandwidth, usually less than 1.2Mbps. DMA approach is the most efficient and is the recommended approach.

To enable DMA operation, set AICCR.TDMS and AICCR.RDMS to 1 for transmit and receive respectively. It also needs to allocate two channels in DMA controller for data transmitting and receiving respectively. Please reference to the processor's DMAC spec for the details.

The AICFR.TFTH and AICFR.RFTH are used to set the transmitting and receiving FIFO level thresholds, which determine the issuing of DMA request to DMA controller. To respond the request, DMAC initiator and controls the data movement between memory and TX/RX FIFO.

14.4.9 Serial Audio Clocks and Sampling Frequencies

For internal CODEC, CODEC module containing the audio CODEC circuit/logic and corresponding controlling registers. CODEC needs a 12MHz clock from CPM and provides BIT_CLK and LR_CLK (left-right clock which is the sample rate as SYNC) to AIC for outgoing and incoming audio respectively. These clocks change when change the sample rate in CODEC controlling registers.

For AC-link, the bit clock is input from chip external and is fixed to 12.288MHz. The sample frequency of 48kHz is supported in nature. Variable Sample Rate feature is supported in this AIC. If the CODEC supports this feature, sample rate other than 48kHz audio data can be replay directly. Otherwise, software has to do the rate transfer to replay other sample rate audio data. Double rate, 96kHz or even 88.2kHz audio is also supported with proper CODEC.

Following are for BIT_CLK/SYS_CLK configuration in I2S/MSB-Justified format with external CODEC.

The BIT_CLK is the rate at which audio data bits enter or leave the AIC. BIT_CLK can be supplied either by the CODEC or an internally PLL. If it is supplied internally, BIT_CLK is configured as output pins, and is supplied to the CODEC. If BIT_CLK is supplied by the CODEC, then it is configured as an input pin. Register bit AICFR.BCKD is used to select BIT_CLK direction.

The audio sampling frequency is the frequency of the SYNC signal, which must be 1/64 of BIT_CLK, $f_{\text{BIT_CLK}} = 64 f_s$.

SYS_CLK is only for CODEC. It usually takes one of the two roles, as CODEC master clock input or as CODEC over-sampling clock input. If SYS_CLK roles as CODEC master clock input, it usually should be set to a fixed frequency according to CODEC requirement but independent to audio sample rate. In this case, usually there is a PLL in the CODEC and CODEC roles master mode. See Figure 14-4 for the interface diagram. This is the recommended AIC CODEC system configuration.

If SYS_CLK roles as CODEC over-sampling clock, its frequency is usually 4, 6, 8 or 12 times of BIT_CLK frequency, which are 256, 384, 512 and 768 times of audio sample rates. Table 14-6 lists the

relation between sample rate, BIT_CLK and SYS_CLK frequencies.

Table 14-6 Audio Sampling rate, BIT_CLK and SYS_CLK frequencies

Sample Rate f_s (kHz)	BIT_CLK (MHz) $f_{\text{BIT_CLK}} = 64 f_s$	SYS_CLK (MHz)			
		$256 f_s$	$384 f_s$	$512 f_s$	$768 f_s$
48	3.072	12.288	18.432	24.576	36.864
44.1	2.8224	11.2896	16.9344	22.5792	33.8688
32	2.048	8.192	12.288	16.384	24.576
24	1.536	6.144	9.216	12.288	18.432
22.05	1.4112	5.6448	8.4672	11.2896	16.9344
16	1.024	4.096	6.144	8.192	12.288
11.025	0.7056	2.8224	4.2336	5.6448	8.4672
8	0.512	2.048	3.072	4.096	6.144

In this processor, SYS_CLK can be selected from EXCLK or generated by dividing the PLL output clock in a CPM divider controlled by I2SCDR. If BIT_CLK is chosen as an output, another divider in AIC is used to divide SYS_CLK for it. Figure 14-14 illustrates the AIC clock generation scheme.

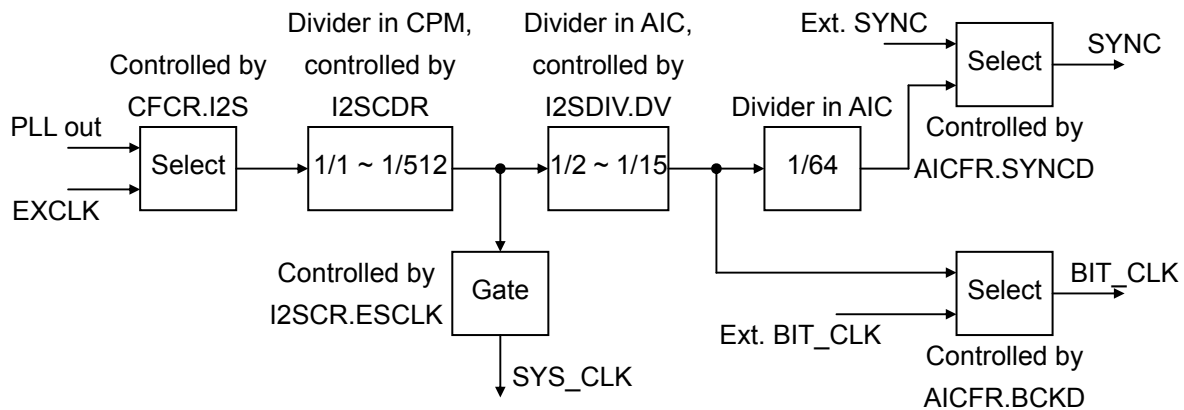

Figure 14-14 SYS_CLK, BIT_CLK and SYNC generation scheme

The setting of I2SDIV.DV is shown in Table 14-7.

Table 14-7 BIT_CLK divider setting

I2SDIV.DV	$f_{\text{SYS_CLK}}$	$f_{\text{BIT_CLK}}$	$f_{\text{SYS_CLK}} / f_{\text{BIT_CLK}}$
0x1	$128 f_s$	$64 f_s$	2
0x2	$196 f_s$	$64 f_s$	3
0x3	$256 f_s$	$64 f_s$	4

0x5	384 f_s	64 f_s	6
0x7	512 f_s	64 f_s	8
0xB	768 f_s	64 f_s	12

As we observe in Table 14-6, if SYS_CLK is taken as over-sampling clock by CODEC, the common multiple of all SYS_CLK frequencies is much bigger than the PLL output clock frequency. To generate all different SYS_CLK frequencies, one approach is change PLL frequency according to sample rate. This is not realistic, since frequently change PLL frequency during normal operation is not recommended.

Another approach is to found some approximate common multiples of all SYS_CLK frequencies according to the fact that there tolerance in audio sample rate. Take $f_{\text{SYS_CLK}} = 256 f_s$, Table 14-8 list most frequencies, which are less than 400MHz, with relatively small sample rate errors. It is suggested to set PLL frequency as close to the frequencies listed as possible, then use clock dividers to generate different SYS_CLK/BIT_CLK for different sample rate.

Table 14-8 Approximate common multiple of SYS_CLK for all sample rates

Approximate Common Frequency (MHz)	Max Error Caused in Audio Sample Rate (%)
123.53	0.53
147.11	0.24
170.68	0.79
235.5	0.87
247.06	0.53
270.64	0.11
280.56	0.73
294.22	0.24
305.14	0.67
317.79	0.53
329.57	0.66
341.35	0.79
347	0.85
353.13	0.90
358.79	0.69
370.59	0.53
382.96	0.54
394.17	0.24

Take PLL = 270.64 MHz as an example, Table 14-9 lists the divider settings for various sample rates.

Table 14-9 CPM/AIC clock divider setting for various sampling rate if PLL = 270.64MHz

Sample Rate (kHz)	I2SCDR	I2SDIV.DV	Sample Rate Error (%)
48	1	11	0.11
44.1	1	12	-0.11
32	0	33	0.11
24	1	22	0.11
22.05	1	24	-0.11
16	1	33	0.11
12	1	44	0.11
11.025	1	48	-0.11
8	1	66	0.11

For an EXCLK clock frequency, try to generate PLL frequencies as close to the frequencies listed in Table 14-8 as possible. Table 14-10 lists the PLL parameters and audio sample errors at different PLL frequencies for EXCLK at 12MHz.

Table 14-10 PLL parameters and audio sample errors for EXCLK=12MHz

PLL			Max Sample Rate Error
M	N	Freq (MHz)	
103	10	123.6	0.59%
49	4	147	0.31%
128	9	170.67	0.79%
157	8	235.5	0.87%
103	5	247.2	0.59%
65	3	260	0.82%
45	2	270	0.35%
203	9	270.67	0.12%
113	5	271.2	0.32%
187	8	280.5	0.75%
237	10	284.4	0.81%
49	2	294	0.31%
178	7	305.14	0.67%
53	2	318	0.60%
302	11	329.45	0.70%
256	9	341.33	0.79%
318	11	346.91	0.88%
206	7	353.14	0.90%
299	10	358.8	0.69%
247	8	370.5	0.55%
351	11	382.91	0.55%
230	7	394.29	0.27%

The BIT_CLK should be stopped temporary when change the divider settings, or when change BIT_CLK source (from internal or external), to prevent clock glitch. Register I2SCR.STPBK is provided to assist the task. When I2SCR.STPBK = 1, BIT_CLK is disabled no matter whether it is generated internally or inputted from the external source. The operation flow is described in following.

- 1 Stop all replay/record by clear AICCR.ERPL and AICCR.EREC.
- 2 Polling I2SSR.BSY till it is 0.
- 3 Stop the BIT_CLK by write 1 to I2SCR.STPBK.
- 4 Operations concerning BIT_CLK.
- 5 Resume the BIT_CLK by write 0 to I2SCR.STPBK.

14.4.10 Interrupts

The following status bits, if enabled, interrupt the processor:

- Receive FIFO Service (AICSR.RFS). It's also DMA Request.
- Transmit FIFO Service (AICSR.TFS). It's also DMA Request.
- Transmit Under-Run (AICSR.TUR).
- Receive Over-Run (AICSR.ROR).
- Command Address and Data Transmitted, AC-link only (ACSR.CADT).
- External CODEC Registers Status Address and Data Received, AC-link only (ACSR.SADR).
- External CODEC Registers Read Status Time Out, AC-link only (ACSR.RSTO).

For further details, see the corresponding register description sections.

15 SAR A/D Controller

15.1 Overview

The A/D embedded in this processor is a CMOS low-power dissipation 12bit SAR analog to digital converter. It operates with 3.3/1.8V power supply. Circuits needed by touch screen function and battery voltage measurement are also included.

The SAR A/D controller is dedicated to control A/D to work at three different modes: Touch Screen (measure pen position and pen down pressure), Battery (check the battery power), and SADCIN (external ADC input). Touch Screen can transfer the data to memory through the DMA or CPU. Battery and SADCIN can transfer the data to memory through CPU.

Features:

- 6 Channel
- Resolution
 - 12-bit
- Integral nonlinearity
 - ± 0.5 LSB
- Differential nonlinearity
 - ± 0.4 LSB
- Resolution/speed
 - up to 12bit 187.5ksps
- Max Frequency
 - 6.0MHz
- Power-down current
 - 1 μ A
- Support touch screen measurement (Through pin XP, XN, YP, YN)
- Support voltage measurement (Through pin PBAT)
- Support external SAR-ADC input (Through pin SADCIN)
- Separate Channel Conversion Mode
- Single-end and Differential Conversion Mode
- Auto X/Y, X/Y/Z and X/Y/Z1/Z2 position measurement

15.2 Pin Description

Table 15-1 SADC Pins Description

Name	I/O	Description
XN	AI	Touch screen analog differential X- position input
YN	AI	Touch screen analog differential Y- position input
XP	AI	Touch screen analog differential X- position input
YP	AI	Touch screen analog differential Y- position input
ADIN0 (PBAT)	AI	Analog input for VBAT measurement
ADIN1 (SADCIN)	AI	External SAR-ADC input

15.3 Register Description

In this section, we will describe the registers in SAR A/D controller. Following table lists all the registers definition. All register's 32bit address is physical address. And detailed function of each register will be described below.

Name	Description	RW	Reset Value	Address	Access Size
ADENA	ADC Enable Register	RW	0x00	0x10070000	8
ADCFG	ADC Configure Register	RW	0x0002002C	0x10070004	32
ADCTRL	ADC Control Register	RW	0x00	0x10070008	8
ADSTATE	ADC Status Register	RW	0x00	0x1007000C	8
ADSAME	ADC Same Point Time Register	RW	0x0000	0x10070010	16
ADWAIT	ADC Wait Time Register	RW	0x0000	0x10070014	16
ADTCH	ADC Touch Screen Data Register	RW	0x00000000	0x10070018	32
ADB DAT	ADC PBAT Data Register	RW	0x0000	0x1007001C	16
ADSDAT	ADC SADCIN Data Register	RW	0x0000	0x10070020	16

15.3.1 ADC Enable Register (ADENA)

The register ADENA is used to trigger A/D to work.

Bits	Name	Description	RW
7	Reserved	Only read and can't write.	R
6:3	Reserved	These bits always read 0, and written are ignored.	R
2	TCHEN ^{*1}	Touch Screen Enable Control. 0: disable 1: enable	RW
1	PBATEN ^{*1}	PBAT Enable Control. Sample the voltage of battery, PBATEN can be set to 1 no matter TCHEN is disable or enable, and when the voltage of battery is ready. PBATEN will be cleared by hardware auto.	RW
0	SADCINEN ^{*1}	SADCIN Enable Control. Sample SADCIN, SADCINEN can be set to 1 no matter TCHEN is disable or enable, and when SADCIN is ready, SADCINEN will be cleared by hardware auto.	RW

NOTES:

- 1 ^{*1}: TCHEN, PBATEN and SADCINEN can be set to 1 at the same time. The priority of the three modes is SADCIN > PBAT > TCH.

15.3.2 ADC Configure Register (ADCFG)

The register ADCFG is used to configure the A/D.

Bits	Name	Description	RW																		
31	SPZZ ^{*1}	The $X_d Y_d Z_m Z_n$ of different point measure can be different. But the $X_d Y_d Z_m Z_n$ of the same point measure can be same or different. 0: The $X_d Y_d Z_m Z_n$ of the same point measure is all the same. ($X_d Y_d Z_1 Z_2, X_d Y_d Z_1 Z_2, X_d Y_d Z_1 Z_2, X_d Y_d Z_1 Z_2 \dots X_d Y_d Z_1 Z_2$) 1: The $X_d Y_d Z_m Z_n$ of the same point measure maybe different. ($X_d Y_d Z_1 Z_2, X_d Y_d Z_3 Z_4, X_d Y_d Z_3 Z_4, X_d Y_d Z_1 Z_2 \dots X_d Y_d Z_1 Z_2$)	RW																		
30	EX_IN	Choose external driver or internal driver. 0: $X_s Y_s$ or $X_s Y_s Z$ 1: $X_d Y_d$ or $X_d Y_d Z$ It is no use for $X_d Y_d Z_m Z_n$. It is no use when $ADCFG.XYZ = 10$. It is useful when $ADCFG.XYZ = 00/01$.	RW																		
29:19	Reserved	These bits always read 0, and written are ignored.	R																		
18:16	DNUM	This will set which is the sampled data is the virtual value. Default: = 3'b010. <table border="1" style="width: 100%; margin-top: 5px;"> <thead> <tr> <th style="width: 30%;">DNUM</th> <th style="width: 70%;">Number</th> </tr> </thead> <tbody> <tr> <td>3'b000</td> <td>Reserved</td> </tr> <tr> <td>3'b001</td> <td>The virtual value is the 2nd sampled data</td> </tr> <tr> <td>3'b010</td> <td>The virtual value is the 3rd sampled data</td> </tr> <tr> <td>3'b011</td> <td>The virtual value is the 4th sampled data</td> </tr> <tr> <td>3'b100</td> <td>The virtual value is the 5th sampled data</td> </tr> <tr> <td>3'b101</td> <td>The virtual value is the 6th sampled data</td> </tr> <tr> <td>3'b110</td> <td>The virtual value is the 7th sampled data</td> </tr> <tr> <td>3'b111</td> <td>The virtual value is the 8th sampled data</td> </tr> </tbody> </table>	DNUM	Number	3'b000	Reserved	3'b001	The virtual value is the 2nd sampled data	3'b010	The virtual value is the 3rd sampled data	3'b011	The virtual value is the 4th sampled data	3'b100	The virtual value is the 5th sampled data	3'b101	The virtual value is the 6th sampled data	3'b110	The virtual value is the 7th sampled data	3'b111	The virtual value is the 8th sampled data	RW
DNUM	Number																				
3'b000	Reserved																				
3'b001	The virtual value is the 2nd sampled data																				
3'b010	The virtual value is the 3rd sampled data																				
3'b011	The virtual value is the 4th sampled data																				
3'b100	The virtual value is the 5th sampled data																				
3'b101	The virtual value is the 6th sampled data																				
3'b110	The virtual value is the 7th sampled data																				
3'b111	The virtual value is the 8th sampled data																				
15	DMA_EN	When A/D is used as Touch Screen (CMD=1100), DMA_EN is used as follows: 0: The sample data is read by CPU 1: The sample data is read by DMA	RW																		
14:13	XYZ	When A/D is used in Touch Screen mode (CMD=1100), XYZ is used as follows:	RW																		

		XYZ	Measure (EX_IN = 1)	Measure (EX_IN = 0)	
		00	$X_d \rightarrow Y_d$	$X_s \rightarrow Y_s$	
		01	$X_d \rightarrow Y_d \rightarrow Z_s$	$X_s \rightarrow Y_s \rightarrow Z_s$	
		10	$X_d \rightarrow Y_d \rightarrow Z1_d \rightarrow Z2_d$ or $X_d \rightarrow Y_d \rightarrow Z3_d \rightarrow Z4_d$	$X_d \rightarrow Y_d \rightarrow Z1_d \rightarrow Z2_d$ or $X_d \rightarrow Y_d \rightarrow Z3_d \rightarrow Z4_d$	
		11	Reserved	Reserved	
12:10	SNUM	The number of repeated sampling one point. When A/D is used as Touch Screen (CMD=1100), SNUM is used as follows:			RW
		SNUM	Number		
		000	1		
		001	2		
		010	3		
		011	4		
		100	5		
		101	6		
		110	8		
		111	9		
9:5	CLKDIV	A/D converter frequency. A/D works at the frequency between 500KHz and 6MHz. If CLKDIV =N, Then the frequency divide number = 12MHz/N+1. 0 < N < 24.			RW
4	BAT_MD	When AD is used as PBAT measure the following channel mode can be chose to measure the battery power. 0: PBAT (full battery voltage >=2.5V) 1: PBAT (full battery voltage <2.5V)			RW

3:0	Reserved	Only read and can't write.	R
-----	----------	----------------------------	---

NOTES:

*1: X_s, Y_s, Z_s means the reference mode of X, Y, Z is single-end mode.

X_d, Y_d, Z1_d, Z2_d, Z3_d, Z4_d means the reference mode of X, Y, Z1, Z2, Z3, Z4 is differential mode.

When you measure X_s you need to make sure that X-plate is driven by external DC power.

When you measure Y_s you need to make sure that Y-plate is driven by external DC power.

15.3.3 ADC Control Register (ADCTRL)

The register ADCTRL is used to control A/D to work.

Bits	Name	Description	RW
7:5	Reserved	These bits always read 0, and written are ignored.	R
4	PENDM	Pen down interrupt mask. 0: enabled 1: masked	RW
3	PENUM	Pen up interrupt mask. 0: enabled	RW

		1: masked	
2	DTCHM	Touch Screen Data Ready interrupt mask. 0: enabled 1: masked	RW
1	DRDYM	PBAT data ready interrupt mask. 0: enabled 1: masked	RW
0	SRDYM	SADCIN Data Ready interrupt mask. 0: enabled 1: masked	RW

15.3.4 ADC Status Register (ADSTATE)

The register ADCSTATE is used to keep the status of A/D.

ADSTS		0x1007000C							
Bit		7	6	5	4	3	2	1	0
		Reserved			PEND	PENU	DTCH	DRDY	SRDY
RST		0	0	0	0	0	0	0	0

Bits	Name	Description	RW
7:5	Reserved	These bits always read 0, and written are ignored.	R
4	PEND	Pen down interrupt flag. Write 1 to this bit, the bit will clear this bit. 1: active 0: not active	RW
3	PENU	Pen up interrupt flag. Write 1 to this bit, the bit will clear this bit. 1: active 0: not active	RW
2	DTCH	Touch screen data ready interrupt flag. Write 1 to this bit, the bit will clear this bit. 1: active 0: not active	RW
1	DRDY	PBAT data ready interrupt flag. Write 1 to this bit, the bit will clear this bit. 1: active 0: not active	RW
0	SRDY	SADCIN Data ready interrupt flag. Write 1 to this bit, the bit will clear this bit.	RW

		1: active 0: not active	
--	--	----------------------------	--

15.3.5 ADC Same Point Time Register (ADSAME)

The register ADSAME is used to store the interval time between repeated sampling the same point. The clock frequency of the counter is 12M/128.

15.3.6 ADC Wait Pen Down Time Register (ADWAIT)

The register ADWAIT is used to store the interval time of wait pen down. And the register can be used as the interval time among the different point. The clock frequency of the counter is 12M/128.

15.3.7 ADC Touch Screen Data Register (ADTCH)

The read-only ADTCH is corresponded to 2x32 bit FIFO, it keep the sample data for touch screen. 0~11 bits are data, 15 bit is data type. 16~27 bits are data, 31 bit is data type. When write to the register, DATA will be clear to 0.

Bits	Name	Description	RW
31	TYPE1	Type of the Touch Screen Data1. When A/D is used as Touch Screen, ADCFG.XYZ=10. TYPE1=1: $X_d \rightarrow Y_d \rightarrow Z1 \rightarrow Z2$ TYPE1=0: $X_d \rightarrow Y_d \rightarrow Z3 \rightarrow Z4$ When A/D is used as Touch Screen, ADCFG.XYZ=00 or XYZ=01, TYPE1=0.	RW
30:28	Reserved	These bits always read 0, and written are ignored.	R
27:16	TDATA1	The concert data of touch screen A/D.	RW
15	TYPE0	Type of the Touch Screen Data2. When A/D is used as Touch Screen, ADCFG.XYZ=10. TYPE0=1: $X_d \rightarrow Y_d \rightarrow Z1 \rightarrow Z2$ TYPE0=0: $X_d \rightarrow Y_d \rightarrow Z3 \rightarrow Z4$ When A/D is used as Touch Screen, ADCFG.XYZ=00 or XYZ=01, TYPE0=0.	RW
14:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	TDATA0	The concert data of touch screen A/D.	RW

NOTES:

- 1 When A/D is used as Touch Screen, EX_IN=0 and ADCFG.XYZ=00.

The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
0	000	Y_s	0	000	X_s

- 2 When A/D is used as Touch Screen, EX_IN=1 and ADCFG.XYZ=00.

The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
0	000	Y_d	0	000	X_d

- 3 When A/D is used as Touch Screen, EX_IN=0 and ADCFG.XYZ=01.

The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
0	000	Y_s	0	000	X_s
0	000	000000000000	0	000	Z_s

Users need to read twice to get the whole data. The first time reading gets the data Y_s and X_s . The second time reading gets the data Z_s . The relation between “touch pressure” and “ Z_s ” are inverse ratio.

- 4 When A/D is used as Touch Screen, EX_IN=1 and ADCFG.XYZ=01.

The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
0	000	Y_d	0	000	X_d
0	000	000000000000	0	000	Z_s

Users need to read twice to get the whole data. The first time reading gets the data Y_d and X_d . The second time reading gets the data Z_s . The relation between “touch pressure” and “ Z_s ” are inverse ratio.

5 When A/D is used as Touch Screen, ADCFG.XYZ=11,TYPE=1.

The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
1	000	Y_d	1	000	X_d
1	000	$Z2_d$	1	000	$Z1_d$

Users need to read twice to get the whole data. The first time reading gets the data Y_d and X_d . The second time reading gets the data $Z2_d$ and $Z1_d$.

The touch pressure measurement formula is as follows: (You can use formula 1 or formula 2.)

$$R_{TOUCH} = R_{X-Plate} \cdot \frac{X-Position \left(\frac{Z_2}{Z_1} - 1 \right)}{4096} \quad (1)^{*1}$$

$$R_{TOUCH} = \frac{R_{X-Plate} \cdot X-Position \left(\frac{4096}{Z_1} - 1 \right) - R_{Y-Plate} \cdot \left(1 - \frac{Y-Position}{4096} \right)}{4096} \quad (2)^{*1}$$

6 When A/D is used as Touch Screen, ADCFG.XYZ=11,TYPE=0.

The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
0	000	Y_d	0	000	X_d
0	000	$Z4_d$	0	000	$Z3_d$

Users need to read twice to get the whole data. The first time reading gets the data Y_d and X_d . The second time reading gets the data $Z4_d$ and $Z3_d$.

The touch pressure measurement formula is as follows: (You can use formula 3 or formula 4.)

$$R_{TOUCH} = R_{Y-Plate} \cdot \frac{Y-Position \left(\frac{Z_4}{Z_3} - 1 \right)}{4096} \quad (3)^{*1}$$

$$R_{TOUCH} = \frac{R_{Y-Plate} \cdot Y-Position \left(\frac{4096}{Z_3} - 1 \right) - R_{X-Plate} \cdot \left(1 - \frac{X-Position}{4096} \right)}{4096} \quad (4)^{*1}$$

NOTES:

*1: To determine pen or finger touch, the pressure of the touch needs to be determined. Generally, it is not necessary to have very high performance for this test; therefore, the 8-bit resolution mode is recommended (however, calculations will be shown here are in 12-bit resolution mode).

$R_{X\text{-plate}}$: Total X-axis resistor value (about 200Ω~ 600Ω)

$R_{Y\text{-plate}}$: Total Y-axis resistor value (about 200Ω~ 600Ω)

X-Position: X-axis voltage sample value

Y-Position: Y-axis voltage sample value

Z1, Z2: Z1, Z2 voltage sample value

Z3, Z4: Z3, Z4 voltage sample value

15.3.8 ADC PBAT Data Register (ADBDAT)

The read-only ADBDAT is a 16-bit register, it keep the sample data of both “PBAT mode”.

0~11 bits are data.

Bits	Name	Description	RW
15:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	BDATA	Data of PBAT A/D convert. When write to the register, DATA will be clear to 0.	RW

When ADCCFG.BAT_MD = 0 (full battery voltage >= 2.5V), the measured voltage V_{BAT} is as follows:

$$V_{BAT} = \frac{BDATA}{4096} \bullet 7.5V * 0.986 + 0.033V$$

When ADCCFG.BAT_MD = 1 (full battery voltage < 2.5V), the measured voltage V_{BAT} is as follows:

$$V_{BAT} = \frac{BDATA}{4096} \bullet 2.5V$$

It is recommended to connect a capacitance of about 0.1uF near to pin ADIN0 to have a more stable battery measurement and better ESD protection.

15.3.9 ADC SADCIN Data Register (ADSDAT)

The read-only ADSDAT is a 16-bit register, it keep the sample data. 0~11 bits are data.

Bits	Name	Description	RW
15:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	SDATA	Data of SADCIN A/D convert. When write to the register, DATA will be clear to 0.	RW

15.4 SAR A/D Controller Guide

The following describes steps of using SAR-ADC.

15.4.1 Single Operation (internal used only)

15.4.2 A simple Touch Screen Operation

(Pen Down → Sample some data of several points → Pen Up)

- 1 Set ADTCTL to 0x1f to mask all the interrupt of SADC.
- 2 Set DMA_EN to choose whether to use DMA to read the sample data out or to use CPU to read the sample data out.
- 3 Set ADCFG.SPZZ, ADCFG.EX_IN and ADCFG.XYZ to choose sample mode.
 - a $X_s \rightarrow Y_s$ (Single-end X → Single-end Y).
 - b $X_d \rightarrow Y_d$ (Differential X → Differential Y).
 - c $X_s \rightarrow Y_s \rightarrow Z_s$ (Single-end X → Single-end Y → Single-end Z).
 - d $X_d \rightarrow Y_d \rightarrow Z_s$ (Differential X → Differential Y → Single-end Z).
 - e $X_d \rightarrow Y_d \rightarrow Z1_d \rightarrow Z2_d$ or $X_d \rightarrow Y_d \rightarrow Z3_d \rightarrow Z4_d$ (Reference register ADCFG.SPZZ)
(Differential X → Differential Y → Differential Z1 → Differential Z2 or
Differential X → Differential Y → Differential Z3 → Differential Z4).
- 4 Set ADCFG.CLKDIV to set A/D clock frequency.
- 5 Set ADWAIT to decide the wait time of pen down and the interval time between sampling different points. This time delay is necessary because when pen is put down or pen position change, there should be some time to wait the pen down signal to become stable.
- 6 Set ADSAME to decide the interval time between repeated sampling the same point. User can repeat sampling one point to get the most accurate data.
- 7 Set ADTCTL.PENDM to 0 to enable the pen down interrupt of touch panel.
- 8 Set ADENA.TCHEN to 1 to start touch panel.
- 9 When pen down interrupt is happened, you should set ADTCTL.PENDM to 1 and clear ADSTATE.PEND to close pen down interrupt. Then you should clear ADSTATE.PENDU and set ADTCTL.PENUM to 0 to enable pen up interrupt.
- 10 When pen down interrupt is happened, the SAR ADC is sampling data. When ADSTATE.DTCH to 1, user must read the sample data from ADTCH. The SAR ADC will not sample the next point until the whole data of the one point are read (no matter by CPU or DMA). If ADCFG.XYZ is mode one and mode two, user only needs to read once to get the whole data. In other modes, user needs to read twice to get the whole data.
- 11 Repeat 10 till pen up interrupt happened.
- 12 When pen up interrupt is happened, you should set ADTCTL.PENUM to 1 and clear ADSTATE.PENU. Then you should clear ADSTATE.PENDD and set ADTCTL.PENPM to 0 to enable pen down interrupt.
- 13 Wait pen down interrupt and repeat from 9.
- 14 When you want to shut down the touch screen, user can set the ADENA.TCHEN to 0. If the

last point is not sampled completely, user can abandon it.

15.4.3 PBAT Sample Operation

- 1 Set ADCFG.CLKDIV to set A/D clock frequency.
- 2 Set ADCFG.CH_MD to choose PBAT test mode channel.
- 3 Set ADENA.PBATEN to 1 to enable the channel.
- 4 When ADSTATE.DRDY = 1, you can read the sample data from ADPBAT. And the PBATEN will be set to 0 auto.

15.4.4 SADCIN Sample Operation

- 1 Set ADCFG.CLKDIV to set A/D clock frequency.
- 2 Set ADENA.SADCINEN to 1 to enable the channel.
- 3 When ADSTATE. SRDY = 1, you can read the sample data from ADSDAT. And the SADCINEN will be set to 0 auto.

NOTE: Touch Screen mode can be interrupt by the PBAT and SADCIN mode. And the priority is SADCIN > PBAT > TOUCH. If SADCINEN or PBATEN is set to 1 before or at the same time with TCHEN, SAR ADC will first work in SADCIN mode then in PBAT mode at last in touch screen mode. If SADCINEN and PBATEN are set to 1 after the TCHEN, the SAR ADC will work in touch screen mode first and finish sampling the same point completely then turn to the SADCIN or PBAT mode. And return to touch screen mode.

15.4.5 Use TSC to support keypad

SADC TSC function can apply to a keypad, if touch screen is not used. Suppose the keypad is a $N \times M$ matrix, where X direction has N key columns and Y direction has M key rows. K_{ij} is used to indicate the key in i th column from left to right and j th row from bottom to top, where $i=0 \sim (N-1)$ and $j=0 \sim (M-1)$. Figure 15-1 is a 6×5 keypad circuit. The blue color is for X direction network and pink color is for Y. The networks are composed by resistors and metal line. These two networks should be connected to SADC 4 pins: XP/XN/YP/YN as illustrated in the figure. The gray circle is the key. When no key pressing, X network and Y network is open circuit. When a key is pressed, the X network and Y network is shorted under the key position.

Figure 15-1 6x5 keypad circuit

When SADC is in waiting for pen-down status ($C=1100$), the equivalent circuit is show in Figure 15-2. When the key is not pressed, XP is open and the PEN is pulled to VDDADC, which is logic 1. When the key K_{ij} is pressed, the circuit is: $VDDADC \rightarrow (10k\Omega \text{ resistor}) \rightarrow R_{XP} \rightarrow R_{YN} \rightarrow VSSADC$.

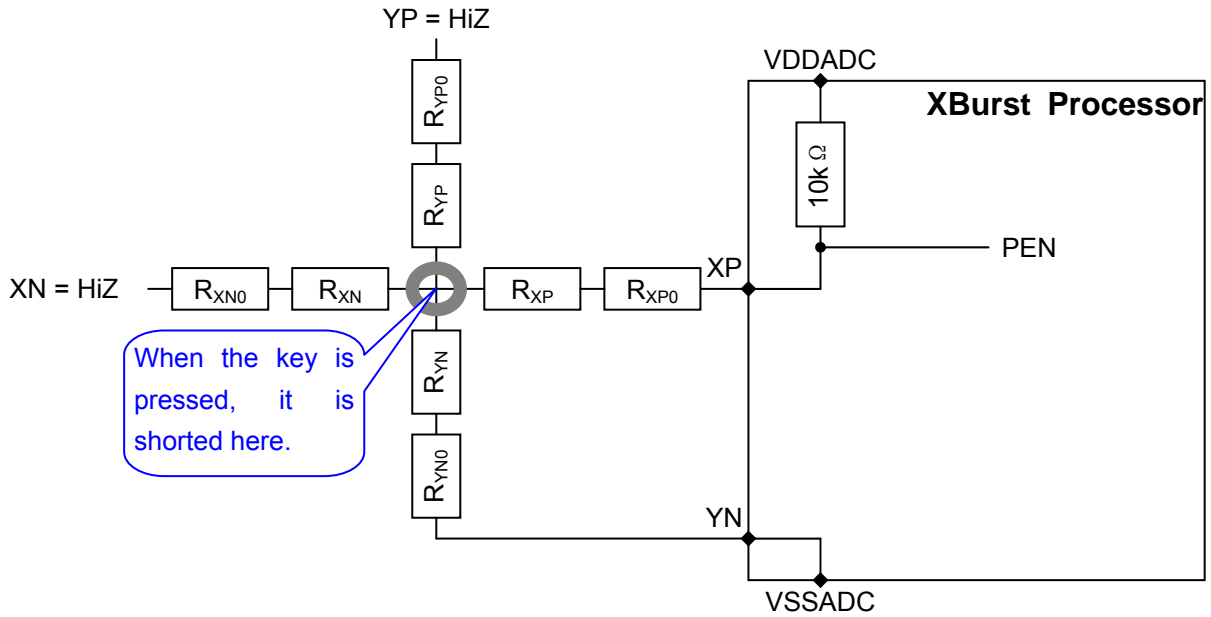

Figure 15-2 Wait for pen-down (C=1100) circuit

Where

$$R_{XP} = \frac{(N-1)^2 - i^2}{M \times (N-1-i) + 2i} \times R$$

$$R_{YN} = \frac{j \times (2M - 2 - j)}{N \times j + 2M - 2 - 2j} \times R$$

To ensure logic 0 at PEN in this case, following formula should be obeyed.

$$R_{XP} + R_{YN} + R_{XP0} + R_{YN0} \leq 3k\Omega \quad (1)$$

It is suggested the value of N and M is as close to each other as possible. For N=2~20, M=2~20 and M=(N-1, N or N+1), we found

$$R_{XP} + R_{YN} < 2.7 \times R \quad (2)$$

After key pressing is found, the key Kij location, columns and row, should be measured by using C=0010 and C=0011 respectively. The equivalent circuits are show in Figure 15-3 and Figure 15-4, where

$$R_{X0} = \frac{N-1}{M-1} \times R$$

$$R_{Y0} = \frac{M-1}{N-1} \times R$$

$$R_{XNi} = i \times R$$

$$R_{XPi} = (N-1-i) \times R$$

$$R_{YNj} = j \times R$$

$$R_{YPj} = (M-1-j) \times R$$

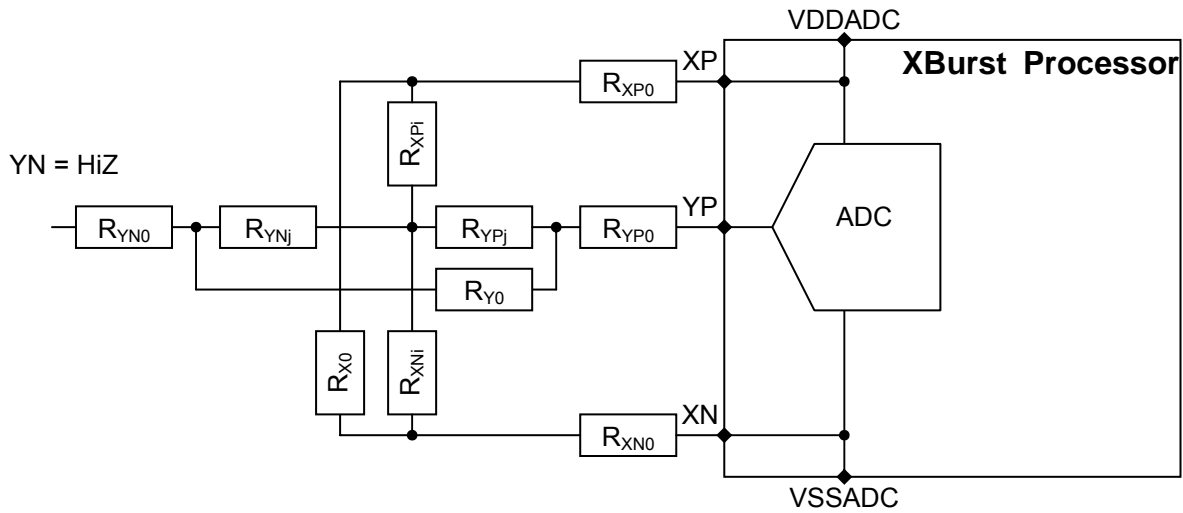

Figure 15-3 Measure X-position (C=0010) circuit

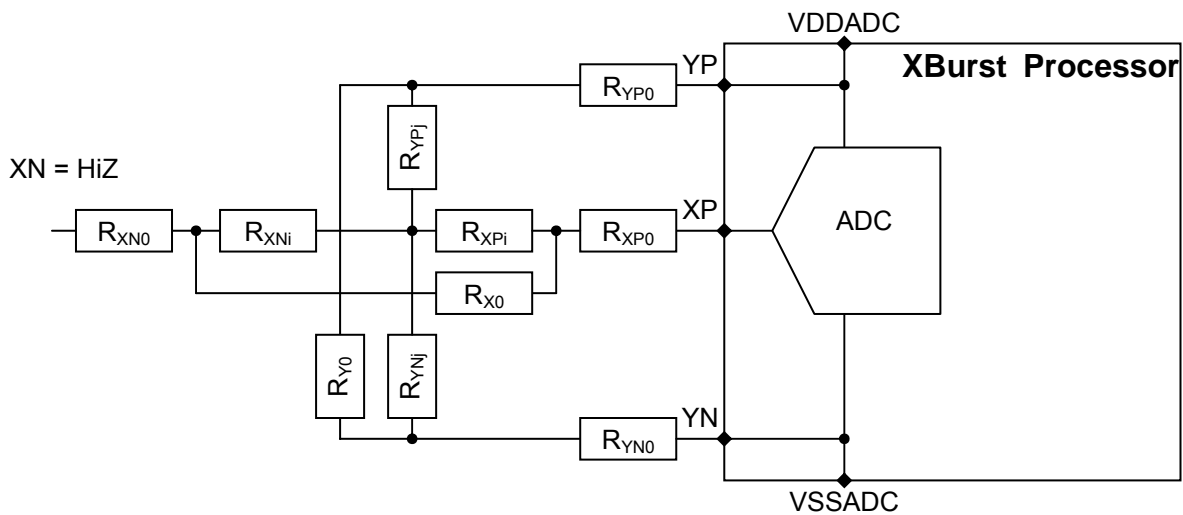

Figure 15-4 Measure Y-position (C=0011) circuit

So for Kij pressing, we should get ADC converted number Ni and Nj for i and j respectively.

$$N_i = \frac{R_{XN0} + \frac{i}{M} R}{R_{XN0} + \frac{N-1}{M} R + R_{XP0}} \times 4096$$

$$N_j = \frac{R_{YN0} + \frac{j}{N} R}{R_{YN0} + \frac{M-1}{N} R + R_{YP0}} \times 4096$$

It is required the resistor between XP and XN in case of C=0010, between YP and YN in case of C=0011, must be $\geq 200\Omega$ and it better be $\geq 500\Omega$. Also consider the requirement in formula (1) and (2) above, we suggest to put $R_{XP0} = R_{XN0} = R_{YP0} = R_{YN0} = 50\Omega$ or 100Ω , put $R = 500\Omega \sim 1k\Omega$.

To use the keypad, the software should set:

ADENA.TCHEN = 1

ADCFG.EX_IN = 1

ADCFG.XYZ = 00

The operation is similar to touch screen.

16 General-Purpose I/O Ports

16.1 Overview

General Purpose I/O Ports (GPIO) is used in generating and capturing application-specific input and output signals. Each port can be programmed as an output, an input or function port that serves certain peripheral. As input, pull up/down can be enabled/disabled for the port and the port also can be configured as level or edge tripped interrupt source.

Features:

- Each port can be configured as an input, an output or an alternate function port
- Each port can be configured as an interrupt source of low/high level or rising/falling edge triggering. Every interrupt source can be masked independently
- Each port has an internal pull-up or pull-down resistor connected. The pull-up/down resistor can be disabled

The GPIO ports, named PA00~31, PB00~31, PC00~31 and PD00~31 are divided into 4 GPIO groups with maximum of 32 GPIO in each group. Group A includes PA00~PA31. Group B includes PB00~PB31; Group C includes PC00~PC31 and Group D include PD00~PD31. GPIO output 4 interrupts, 1 for every group, to INTC.

For every group, 23 memory-mapped 32-bit registers can be used to operate the GPIO ports:

- | | |
|----------------------------------|--------------------------------------|
| • PAPIN, PBPIN, PCPIN, PDPIN | - PORT PIN Level Register |
| • PADAT, PBDAT, PCDAT, PDDAT | - PORT Data Register |
| • PADATS, PBDATS, PCDATS, PDDATS | - PORT Data Set Register |
| • PADATC, PBDATC, PCDATC, PDDATC | - PORT Data Clear Register |

NOTES:

- 1 PC30: GPIO group C bit 30. If NAND flash is used, this pin must be used as NAND FRB. (NAND flash ready/busy).
- 2 PC31: GPIO group C bit 31. No corresponding pin exists for this GPIO. It is only used to

select the function between UART and JTAG, which share the same set of pins, by using register PCSEL [31].

When PCSEL [31]=0, select JTAG function.

When PCSEL [31]=1, select UART function.

- 3 PD14 is output 0 during the reset (PPRST_, WDT-reset and hibernating-reset) period.
- 4 The input/output direction of GPD16 pin is controlled by PDDIR[15] when GPD16 is used as GPIO function.
- 5 PD29 is only used as input and interrupt only, and with no pull-up and pull-down.
- 6 This GPIO pin is not available in JZ4725.
- 7 This GPIO pin is not available in JZ 4720.

16.2 Register Description

Table 16-5 summarized all memory-mapped registers, which can be programmed to operate GPIO port and alternate function port sharing configuration.

All registers are in 32-bits width. Usually, 1 bit in the register affects a corresponding GPIO port and every GPIO port can be operated independently.

Table 16-5 GPIO Registers

Name	Description	RW	Reset Value	Address	Size
GPIO PORT A					
PAPIN	PORT A PIN Level Register	R	0x00000000	0x10010000	32
PADAT	PORT A Data Register	R	0x00000000	0x10010010	32
PADATS	PORT A Data Set Register	W	0x????????	0x10010014	32
PADATC	PORT A Data Clear Register	W	0x????????	0x10010018	32

NOTE: PX**** in the description of register as follows means PA****, PB****, PC**** and PD****.

16.2.1 PORT PIN Level Register (PAPIN, PBPIN, PCPIN, PDPIN)

PAPIN, PBPIN, PCPIN and PDPIN are four 32-bit PORT PIN level registers. They are read-only registers.

PAPIN, PBPIN, PCPIN, PDPIN																0x10010000, 0x10010100, 0x10010200, 0x10010300																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PINL31	PINL30	PINL29	PINL28	PINL27	PINL26	PINL25	PINL24	PINL23	PINL22	PINL21	PINL20	PINL19	PINL18	PINL17	PINL16	PINL15	PINL14	PINL13	PINL12	PINL11	PINL10	PINL09	PINL08	PINL07	PINL06	PINL05	PINL04	PINL03	PINL02	PINL01	PINL00
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	R/W
n	PINL n	Where n = 0 ~ 31 and PINL n = PINL0 ~ PINL31. The PORT PIN level can be read by reading PINL n bit in register PXPIN.	R

PAPIN bits 31-0 correspond to PA31-0; PBPIN to PB31-0; PCPIN to PC31-0 and PDPIN to PD 31-0.

16.2.2 PORT Data Register (PADAT, PBDAT, PCDAT, PDDAT)

PADAT, PBDAT, PCDAT and PDDAT are four 32-bit PORT DATA registers. They are read-only registers.

PADAT, PBDAT, PCDAT, PDDAT																0x10010010, 0x10010110, 0x10010210, 0x10010310																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA31	DATA30	DATA29	DATA28	DATA27	DATA26	DATA25	DATA24	DATA23	DATA22	DATA21	DATA20	DATA19	DATA18	DATA17	DATA16	DATA15	DATA14	DATA13	DATA12	DATA11	DATA10	DATA09	DATA08	DATA07	DATA06	DATA05	DATA04	DATA03	DATA02	DATA01	DATA00
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	R/W
n	DATA n	Where n = 0 ~ 31 and DATA n = DATA0 ~ DATA31. The register is used as GPIO data register. When GPIO is used as interrupt the register is no used.	R

PADAT bits 31-0 correspond to PA31-0; PBDAT to PB31-0; PCDAT to PC31-0 and PDDAT to PD 31-0.

16.2.3 PORT Data Set Register (PADATS, PBDATS, PCDATS, PDDATS)

PADATS, PBDATS, PCDATS and PDDATS are four 32-bit PORT DATA set registers. They are write-only registers.

PADATS, PBDATS, PCDATS, PDDATS																0x10010014, 0x10010114, 0x10010214, 0x10010314																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATAS31	DATAS30	DATAS29	DATAS28	DATAS27	DATAS26	DATAS25	DATAS24	DATAS23	DATAS22	DATAS21	DATAS20	DATAS19	DATAS18	DATAS17	DATAS16	DATAS15	DATAS14	DATAS13	DATAS12	DATAS11	DATAS10	DATAS09	DATAS08	DATAS07	DATAS06	DATAS05	DATAS04	DATAS03	DATAS02	DATAS01	DATAS00
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	DATAS n	Writing 1 to DATAS n will set DATA n to 1 in register PXDAT. Writing 0 to DATAS n will no use.	W

PADATS bits 31-0 correspond to PA31-0; PBDATS to PB31-0; PCDATS to PC31-0 and PDDATS to PD 31-0.

16.2.4 PORT Data Clear Register (PADATC, PBDATC, PCDATC, PDDATC)

PADATC, PBDATC, PCDATC and PDDATC are four 32-bit PORT DATA clear registers. They are write-only registers.

PADATC, PBDATC, PCDATC, PDDATC																0x10010018, 0x10010118, 0x10010218, 0x10010318																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	DATAC n	Writing 1 to DATAC n will set DATA n to 0 in register PXDAT. Writing 0 to DATAC n will no use.	W

PADATC bits 31-0 correspond to PA31-0; PBDATC to PB31-0; PCDATC to PC31-0 and PDDATC to PD 31-0.

16.2.5 PORT Mask Register (PAIM, PBIM, PCIM, PDIM)

PAIM, PBIM, PCIM and PDIM are four 32-bit PORT MASK registers. They are read-only registers.

Bits	Name	Description	R/W
n	MASK n	Where n = 0 ~ 31 and MASK n = MASK0 ~ MASK31. MASK n is used for mask the interrupt of GPIO n. 0: Enable the pin as an interrupt source 1: Disable the pin as an interrupt source	R

PAIM bits 31-0 correspond to PA31-0; PBIM to PB31-0; PCIM to PC31-0 and PDIM to PD 31-0.

16.2.6 PORT Mask Set Register (PAIMS, PBIMS, PCIMS, PDIMS)

PAIMS, PBIMS, PCIMS and PIMS are four 32-bit PORT MASK set registers. They are write-only registers.

Bits	Name	Description	R/W
n	MASKS n	Writing 1 to MASKS n will set MASK n to 1 in register PXIM. Writing 0 to MASKS n will no use.	W

PAIMS bits 31-0 correspond to PA31-0; PBIMS to PB31-0; PCIMS to PC31-0 and PDIMS to PD 31-0.

16.2.7 PORT Mask Clear Register (PAIMC, GBPIMC, PCIMC, PDIMC)

PAIMC, PBIMC, PCIMC and PDIMC are four 32-bit PORT MASK clear registers. They are write-only registers.

PAIMS, PBIMC, PCIMC, PDIMC				0x10010028, 0x10010128, 0x10010228, 0x10010328																													
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	MASKC n	Writing 1 to MASKC n will set MASK n to 0 in register PXIM. Writing 0 to MASKC n will no use.	W

PAIMC bits 31-0 correspond to PA31-0; PBIMC to PB31-0; PCIMC to PC31-0 and PDIMC to PD 31-0.

16.2.8 PORT PULL Disable Register (PAPE, PBPE, PCPE, PDPE)

PAPE, PBPE, PCPE and PDPE are four 32-bit PORT PULL disable registers. They are read-only registers.

PAPE, PBPE, PCPE, PDPE				0x10010030, 0x10010130, 0x10010230, 0x10010330																												
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PULL31	PULL30	PULL29	PULL28	PULL27	PULL26	PULL25	PULL24	PULL23	PULL22	PULL21	PULL20	PULL19	PULL18	PULL17	PULL16	PULL15	PULL14	PULL13	PULL12	PULL11	PULL10	PULL09	PULL08	PULL07	PULL06	PULL05	PULL04	PULL03	PULL02	PULL01	PULL00
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	R/W
n	PULL n	Where n = 0 ~ 31 and PULL n = PULL0 ~ PULL31. PULL n is used for setting the port to be PULL UP or PULL DOWN enable. 1: No pull up or pull down resistor connects to the port 0: An internal pull up or pull down resistor connects to the port. Up or down is pin dependence	R

PAPE bits 31-0 correspond to PA31-0; PBPE to PB31-0; PCPE to PC31-0 and PDPE to PD 31-0.

16.2.9 PORT PULL Set Register (PAPES, PBPE, PCPE, PDPE)

PAPES, PBPE, PCPE and PDPE are four 32-bit PORT PULL set registers. They are write-only registers.

PAPES, PBPE, PCPE, PDPE																0x10010034, 0x10010134, 0x10010234, 0x10010334																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	PULLS n	Writing 1 to PULLS n will set PULL n to 1 in register PXPE. Writing 0 to PULLS n will no use.	W

PAPES bits 31-0 correspond to PA31-0; PBPE to PB31-0; PCPE to PC31-0 and PDPE to PD 31-0.

16.2.10 PORT PULL Clear Register (PAPEC, PBPEC, PCPEC, PDPEC)

PAPEC, PBPEC, PCPEC and PDPEC are four 32-bit PORT PULL clear registers. They are write-only registers.

PAPES, PBPEC, PCPEC, PDPEC																0x10010038, 0x10010138, 0x10010238, 0x10010338																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	PULLC n	Writing 1 to PULLC n will set PULL n to 0 in register PXPE. Writing 0 to PULLC n will no use.	W

PAPEC bits 31-0 correspond to PA31-0; PBPEC to PB31-0; PCPEC to PC31-0 and PDPEC to PD 31-0.

16.2.11 PORT Function Register (PAFUN, PBFUN, PCFUN, PDFUN)

PAFUN, PBFUN, PCFUN and PDFUN are four 32-bit PORT function registers. They are read-only registers.

PAFUN, PBFUN, PCFUN, PDFUN																0x10010040, 0x10010140, 0x10010240, 0x10010340																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FUN31	FUN30	FUN29	FUN28	FUN27	FUN26	FUN25	FUN24	FUN23	FUN22	FUN21	FUN20	FUN19	FUN18	FUN17	FUN16	FUN15	FUN14	FUN13	FUN12	FUN11	FUN10	FUN09	FUN08	FUN07	FUN06	FUN05	FUN04	FUN03	FUN02	FUN01	FUN00
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	R/W
n	FUN n	Where n = 0 ~ 31 and FUN n = FUN0 ~ FUN31. In most cases, port is shared with one or more peripheral functions. FUN n controls the owner of the port n. 0: GPIO or Interrupt 1: Alternate Function (Function 0 ^{**1} or Function 1 ^{**1})	R

PAFUN bits 31-0 correspond to PA31-0; PBFUN to PB31-0; PCFUN to PC31-0 and PDFUN to PD 31-0.

16.2.12 PORT Function Set Register (PAFUNS, PBFUNS, PCFUNS, PDFUNS)

PAFUNS, PBFUNS, PCFUNS and PDFUNS are four 32-bit PORT function set registers. They are write-only registers.

PAFUNS, PBFUNS, PCFUNS, PDFUNS																0x10010044, 0x10010144, 0x10010244, 0x10010344																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FUNS31	FUNS30	FUNS29	FUNS28	FUNS27	FUNS26	FUNS25	FUNS24	FUNS23	FUNS22	FUNS21	FUNS20	FUNS19	FUNS18	FUNS17	FUNS16	FUNS15	FUNS14	FUNS13	FUNS12	FUNS11	FUNS10	FUNS09	FUNS08	FUNS07	FUNS06	FUNS05	FUNS04	FUNS03	FUNS02	FUNS01	FUNS00
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	FUNS n	Writing 1 to FUNS n will set FUN n to 1 in register PXFUN. Writing 0 to FUNS n will no use.	W

PAFUNS bits 31-0 correspond to PA31-0; PBFUNS to PB31-0; PCFUNS to PC31-0 and PDFUNS to PD 31-0.

16.2.13 PORT Function Clear Register (PAFUNC, PBFUNC, PCFUNC, PDFUNC)

PAFUNC, PBFUNC, PCFUNC and PDFUNC are four 32-bit PORT function clear registers. They are write-only registers.

PAFUNC, PBFUNC, PCFUNC, PDFUNC																0x10010048, 0x10010148, 0x10010248, 0x10010348																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FUNC31	FUNC30	FUNC29	FUNC28	FUNC27	FUNC26	FUNC25	FUNC24	FUNC23	FUNC22	FUNC21	FUNC20	FUNC19	FUNC18	FUNC17	FUNC16	FUNC15	FUNC14	FUNC13	FUNC12	FUNC11	FUNC10	FUNC09	FUNC08	FUNC07	FUNC06	FUNC05	FUNC04	FUNC03	FUNC02	FUNC01	FUNC00
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	FUNC n	Writing 1 to FUNC n will set FUN n to 0 in register PXFUN. Writing 0 to FUNC n will no use.	W

PAFUNC bits 31-0 correspond to PA31-0; PBFUNC to PB31-0; PCFUNC to PC31-0 and PDFUNC to PD 31-0.

16.2.14 PORT Select Register (PASEL, PBSEL, PCFSEL, PDSEL)

PASEL, PBSEL, PCSEL and PDSEL are four 32-bit PORT select registers. They are read-only registers.

PASEL, PBSEL, PCSEL, PDSEL																0x10010050, 0x10010150, 0x10010250, 0x10010350																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SEL31	SEL30	SEL29	SEL28	SEL27	SEL26	SEL25	SEL24	SEL23	SEL22	SEL21	SEL20	SEL19	SEL18	SEL17	SEL16	SEL15	SEL14	SEL13	SEL12	SEL11	SEL10	SEL09	SEL08	SEL07	SEL06	SEL05	SEL04	SEL03	SEL02	SEL01	SEL00
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

Bits	Name	Description	R/W
n	SEL n	Where n = 0 ~ 31 and SEL n = SEL0 ~ SEL31. SEL n is used for selecting the function of GPIO. When PXFUN = 0: 0: GPIO 1: Interrupt When PXFUN = 1: 0: Alternate Function 0*1 1: Alternate Function 1*1	R

PASEL bits 31-0 correspond to PA31-0; PBSEL to PB31-0; PCSEL to PC31-0 and PDSEL to PD 31-0.

16.2.15 PORT Select Set Register (PASELS, PBSELS, PCSELS, PDSELS)

PASELS, PBSELS, PCSELS and PDSELS are four 32-bit PORT select set registers. They are write-only registers.

PASELS, PBSELS, PCSELS, PDSELS																0x10010054, 0x10010154, 0x10010254, 0x10010354																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SELS31	SELS30	SELS29	SELS28	SELS27	SELS26	SELS25	SELS24	SELS23	SELS22	SELS21	SELS20	SELS19	SELS18	SELS17	SELS16	SELS15	SELS14	SELS13	SELS12	SELS11	SELS10	SELS09	SELS08	SELS07	SELS06	SELS05	SELS04	SELS03	SELS02	SELS01	SELS00
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	SELS n	Writing 1 to SELS n will set SEL n to 1 in register PXSEL. Writing 0 to SELS n will no use.	W

PASELS bits 31-0 correspond to PA31-0; PBSELS to PB31-0; PCSELS to PC31-0 and PDSELS to PD 31-0.

16.2.16 PORT Select Clear Register (PASELC, PBSELC, PCSELC, PDSELC)

PASELC, PBSELC, PCSELC and PDSELC are four 32-bit PORT select clear registers. They are write-only registers.

PASELC, PBSELC, PCSELC, PDSELC																0x10010058, 0x10010158, 0x10010258, 0x10010358																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SELC31	SELC30	SELC29	SELC28	SELC27	SELC26	SELC25	SELC24	SELC23	SELC22	SELC21	SELC20	SELC19	SELC18	SELC17	SELC16	SELC15	SELC14	SELC13	SELC12	SELC11	SELC10	SELC09	SELC08	SELC07	SELC06	SELC05	SELC04	SELC03	SELC02	SELC01	SELC00
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	SELC n	Writing 1 to SELC n will set SEL n to 0 in register PXSEL. Writing 0 to SELC n will no use.	W

PASELC bits 31-0 correspond to PA31-0; PBSELC to PB31-0; PCSELC to PC31-0 and PDSELC to PD 31-0.

16.2.17 PORT Direction Register (PADIR, PBDIR, PCDIR, PDDIR)

PADIR, PBDIR, PCDIR and PDDIR are four 32-bit PORT direction registers. They are read-only registers.

PADIR, PBDIR, PCDIR, PDDIR																0x10010060, 0x10010160, 0x10010260, 0x10010360																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DIR31	DIR30	DIR29	DIR28	DIR27	DIR26	DIR25	DIR24	DIR23	DIR22	DIR21	DIR20	DIR19	DIR18	DIR17	DIR16	DIR15	DIR14	DIR13	DIR12	DIR11	DIR10	DIR09	DIR08	DIR07	DIR06	DIR05	DIR04	DIR03	DIR02	DIR01	DIR00
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	R/W
n	DIR n	Where n = 0 ~ 31 and DIR n = DIR0 ~ DIR31. DIR n is used for setting the direction of port or setting the trigger direction of interrupt trigger. GPIO Direction: (GPIO Function) 0: INPUT 1: OUTPUT Interrupt Trigger Direction: (Interrupt Function) PXTRG = 0: 0: Low Level Trigger 1: High Level Trigger PXTRG =1: 0: Falling Edge Trigger 1: Rising Edge Trigger	R

PADIR bits 31-0 correspond to PA31-0; PBDIR to PB31-0; PCDIR to PC31-0 and PDDIR to PD 31-0.

16.2.18 PORT Direction Set Register (PADIRS, PBDIRS, PCDIRS, PDDIRS)

PADIRS, PBDIRS, PCDIRS and PDDIRS are four 32-bit PORT direction set registers. They are write-only registers.

PADIRS, PBDIRS, PCDIRS, PDDIRS																0x10010064, 0x10010164, 0x10010264, 0x10010364																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DIRS31	DIRS30	DIRS29	DIRS28	DIRS27	DIRS26	DIRS25	DIRS24	DIRS23	DIRS22	DIRS21	DIRS20	DIRS19	DIRS18	DIRS17	DIRS16	DIRS15	DIRS14	DIRS13	DIRS12	DIRS11	DIRS10	DIRS09	DIRS08	DIRS07	DIRS06	DIRS05	DIRS04	DIRS03	DIRS02	DIRS01	DIRS00

RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	TRIGS n	Writing 1 to TRIGS n will set TRIG n to 1 in register PXTRG. Writing 0 to TRIGS n will no use.	W

PATRGS bits 31-0 correspond to PA31-0; PBTRGS to PB31-0; PCTRGS to PC31-0 and PDTRGS to PD 31-0.

16.2.22 PORT Trigger Clear Register (PATRGC, PBTRGC, PCTRGC, PDTRGC)

PATRGC, PBTRGC, PCTRGC and PDTRGC are four 32-bit PORT trigger clear registers. They are write-only registers.

PATRGC, PBTRGC, PCTRGC, PDTRGC																0x10010078, 0x10010178, 0x10010278, 0x10010378																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRIGC31	TRIGC30	TRIGC29	TRIGC28	TRIGC27	TRIGC26	TRIGC25	TRIGC24	TRIGC23	TRIGC22	TRIGC21	TRIGC20	TRIGC19	TRIGC18	TRIGC17	TRIGC16	TRIGC15	TRIGC14	TRIGC13	TRIGC12	TRIGC11	TRIGC10	TRIGC09	TRIGC08	TRIGC07	TRIGC06	TRIGC05	TRIGC04	TRIGC03	TRIGC02	TRIGC01	TRIGC00
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	TRIGC n	Writing 1 to TRIGC n will set TRIG n to 0 in register PXTRG. Writing 0 to TRIGC n will no use.	W

PATRGC bits 31-0 correspond to PA31-0; PBTRGC to PB31-0; PCTRGC to PC31-0 and PDTRGC to PD 31-0.

PD 31-0.

16.2.23 PORT FLAG Register (PAFLG, PBFLG, PCFLG, PDFLG)

PAFLG, PBFLG, PCFLG and PDFLG are four 32-bit GPIO FLAG registers. They are read-only registers.

PAFLG, PBFLG, PCFLG, PDFLG																0x10010080, 0x10010180, 0x10010280, 0x10010380																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FLAG31	FLAG30	FLAG29	FLAG28	FLAG27	FLAG26	FLAG25	FLAG24	FLAG23	FLAG22	FLAG21	FLAG20	FLAG19	FLAG18	FLAG17	FLAG16	FLAG15	FLAG14	FLAG13	FLAG12	FLAG11	FLAG10	FLAG09	FLAG08	FLAG07	FLAG06	FLAG05	FLAG04	FLAG03	FLAG02	FLAG01	FLAG00
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	R/W
n	FLAG n	Where n = 0 ~ 31 and FLAG n = FLAG00 ~ FLAG31. FLAG n is interrupt flag bit for checking the interrupt whether to happen. When GPIO is used as interrupt function and the interrupt happened, the FLAG n in PXFLG will be set to 1.	R

PAFLG bits 31-0 correspond to PA31-0; PBFLG to PB31-0; PCFLG to PC31-0 and PDFLG to PD 31-0.

16.2.24 PORT FLAG Clear Register (PAFLGC, PBFLGC, PCFLGC, PDFLGC)

PAFLGC, PBFLGC, PCFLGC and PDFLGC are four 32-bit GPIO FLAG Clear registers. They are read-only registers.

PAFLGC, PBFLGC, PCFLGC, PDFLGC																0x10010014, 0x10010114, 0x10010214, 0x10010314																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FLAGC31	FLAGC30	FLAGC29	FLAGC28	FLAGC27	FLAGC26	FLAGC25	FLAGC24	FLAGC23	FLAGC22	FLAGC21	FLAGC20	FLAGC19	FLAGC18	FLAGC17	FLAGC16	FLAGC15	FLAGC14	FLAGC13	FLAGC12	FLAGC11	FLAGC10	FLAGC09	FLAGC08	FLAGC07	FLAGC06	FLAGC05	FLAGC04	FLAGC03	FLAGC02	FLAGC01	FLAGC00
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	R/W
n	FLAGC n	When GPIO is used as interrupt function and when write 1 to the bit, the bit FLAG n in PXFLG will be cleared.	R

PAFLGC bits 31-0 correspond to PA31-0; PBFLGC to PB31-0; PCFLGC to PC31-0 and PDFLGC to PD 31-0.

16.3 Program Guide

16.3.1 GPIO Function Guide

- 1 Set PXFUN to choose the function of GPIO / Interrupt by writing 1 to register PXFUNC.
- 2 Set PXSEL to choose the function of GPIO by writing 1 to register PXSELC.
- 3 Set PXDIR to choose the direction of GPIO by writing 1 to register PXDIRS or PXDIRC.
- 4 Others.
 - a You can read the PORT PIN level by reading register PXPIN.
 - b You can use register PXDAT as normal data register. The register can be set by register PXDATS and PXDATC.
 - c You can set PXPE by writing 1 to register PXPES or PXPE to use Internal pull-up/down resistor or not.

16.3.2 Alternate Function Guide

- 1 Set PXFUN to 0 by writing 1 to register PXFUNC. (Ready state)
- 2 Set PXSEL to choose the alternate function 0 by writing 1 to register PXSELC.
Set PXSEL to choose the alternate function 1 by writing 1 to register PXSELS.
- 3 Set PXFUN to choose the function of alternate function by writing 1 to register PXFUNS.

16.3.3 Interrupt Function Guide

First you should keep GPIO status.

- 1 Set PXIM by writing 1 to register PXIMS.
- 2 Set PXTRG to choose the interrupt trigger mode by writing 1 to register PXTRGS or PXTRGC.
- 3 Set PXFUN to choose the function of GPIO / Interrupt by writing 1 to register or PXFUNC.
- 4 Set PXSEL to choose the Interrupt function by writing 1 to register PXSELS.
- 5 Set PXDIR to choose the direction of interrupt trigger by writing 1 to register PXDIRS or PXDIRC.
- 6 Set the PXFLGC register to clear the interrupt flag.
- 7 Clear PXIM by writing 1 to register PXIMC to enable the GPIO interrupt.

16.3.4 Disable Interrupt Function Guide

- 1 Set PXIM by writing 1 to register PXIMS.
- 2 Set PXTRG to 0 by writing 1 to register PXTRGC.
- 3 Set PXDIR to 0 by writing 1 to register PXDIRC.
- 4 Set PXFUN to 0 by writing 1 to register or PXFUNC.
- 5 Set PXSEL to 0 by writing 1 to register PXSELC.

17 I2C Bus Interface

17.1 Overview

The I2C bus was created by the Phillips Corporation and is a serial bus with a two-pin interface. The SDA data pin is used for input and output functions and the SCL clock pin is used to control and reference the I2C bus. The I2C unit allows the processor to serve as a master and slave device that resides on the I2C bus. The I2C unit enables the processor to communicate with I2C peripherals and microcontrollers for system management functions. The I2C bus requires a minimum amount of hardware to relay status and reliability information concerning the processor subsystem to an external device. The I2C unit is a peripheral device that resides on the processor internal bus. Data is transmitted to and received from the I2C bus via a buffered interface. Control and status information is relayed through a set of memory-mapped registers. Refer to *The I2C-Bus Specification* for complete details on I2C bus operation.

The I2C has the following features:

- Supports only single master mode
- Supports I2C standard-mode and F/S-mode up to 400 kHz
- I2C receiver and transmitter are double-buffered
- Supports burst reading or writing of data
- Supports random writing access of data
- Supports general call address and START byte format after START condition
- Independent, programmable serial clock generator
- Supports slave coping with fast master during data transfers by holding the SCL line on a bit level
- The number of devices that you can connect to the same I2C-bus is limited only by the maximum bus capacitance of 400pF

17.2 Pin Description

Table 17-1 Smart Card Controller Pins Description

Name	I/O	Description
SDA	Input/Output	I2C Serial Clock Line signal.
SCL	Input/Output	I2C Serial Data/Address signal.

17.3 Register Description

Table 17-2 I2C Registers Description

Name	RW	Reset Value	Address	Access Size
I2CDR	RW	0x??	0x10042000	8
I2CCR	RW	0x00	0x10042004	8
I2CSR	RW	0x04	0x10042008	8
I2CGR	RW	0x0000	0x1004200C	16

17.3.1 Data Register (I2CDR)

Bits	Name	Description	RW
7:0	DR	Data port of HW FIFO.	RW

17.3.2 Control Register (I2CCR)

NOTE:

*: STA and STO can only be written with 1.

Bits	Name	Description	RW
7:5	Reserved	These bits always read as 0. Write data to these bits are ignored.	R
4	IEN	I2C interrupt bit. 0: Disable I2C interrupt; 1: Enable I2C interrupt.	RW
3	STA	I2C START bit. 0: START condition will not be sent to I ² C bus; 1: START condition will be sent to I ² C bus.	RW
2	STO	I2C STOP bit. 0: STOP condition won't be sent to I ² C bus; 1: STOP	RW

		condition will be sent to I ² C bus.	
1	AC	I2C Acknowledge Control Bit. 0: will be sent to I ² C bus as LOW level acknowledge signal; 1: will be sent to I ² C bus as HIGH level acknowledge signal.	RW
0	I2CE	Enable of I2C. 0: I2C module is disabled; 1: I2C module is enabled.	RW

17.3.3 Status Register (I2CSR)

Bits	Name	Description	RW
7:5	Reserved	These bits always read as 0. Write data to these bits are ignored.	R
4	STX	STA/STO Command is On. 0: STA/STO FIFO buffer is empty; 1: STA/STO FIFO buffer is not empty.	R
3	BUSY	I2C Bus Busy. 0: I2C bus is free; 1: I2C bus is busy.	R
2	TEND	Transmission End Flag. 0: Byte transmission or acknowledge bit for that byte has not completed; 1: The I2C is in transmission idle state.	R
1	DRF	Data Register Valid Flag. 0: Data in I2CDR is invalid; 1: Data in I2CDR is valid.	R W
0	ACKF	Acknowledge Level Flag. 0: The acknowledge signal from I ² C-bus is "0"; 1: The acknowledge signal from I ² C-bus is "1".	R

17.3.4 Clock Generator Register (I2CGR)

Bits	Name	Description	RW
15:01	GR	Sets the frequency of serial clock. The serial clocks frequency is calculated as follows: [Value of I2CGR] = [Frequency of Device_clock] / (16 * [SCL clock	RW

		rate]) – 1	
--	--	-------------	--

NOTE: To make the I2C operate normally, frequency of PCLK (APB-bus clock) should not lower than transfer 2 * [byte rate].

17.4 I²C-Bus Protocol

17.4.1 Bit Transfer

Due to the variety of different technology devices (CMOS, NMOS, bipolar) which can be connected to the I²C-bus, the levels of the logical '0' (LOW) and '1' (HIGH) are not fixed and depend on the associated level of VDD. One clock pulse is generated for each data bit transferred.

17.4.2 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW states of the data line can only change when the clock signal on the SCL line is LOW.

17.4.3 START and STOP Conditions

A HIGH to LOW transition on the SDA line while SCL is HIGH indicates a START condition. A LOW to HIGH transition on the SDA line while SCL is HIGH defines a STOP condition.

17.4.4 Byte Format

- 1 Every byte put on the SDA line must be 8-bits width.
- 2 The number of bytes that can be transmitted/received per transfer is unrestricted.
- 3 Each byte has to be followed by an acknowledge (ack/nack) bit.
- 4 Data is transferred with the most significant bit (MSB) first.
- 5 Data transfer with an acknowledge signal (acknowledge or not-acknowledge) is obligatory.
- 6 The acknowledge_ related clock pulse is generated by the master.
- 7 The transmitter releases the SDA line (HIGH) during the acknowledge clock pulse. The receiver must pull down the SDA line during the acknowledge clock pulse so that it remains stable LOW during the HIGH period of this clock pulse.
- 8 Slave can hold the SCL line LOW during the SCL in LOW level at any bit to force the master to proceed a lower speed of transfer.

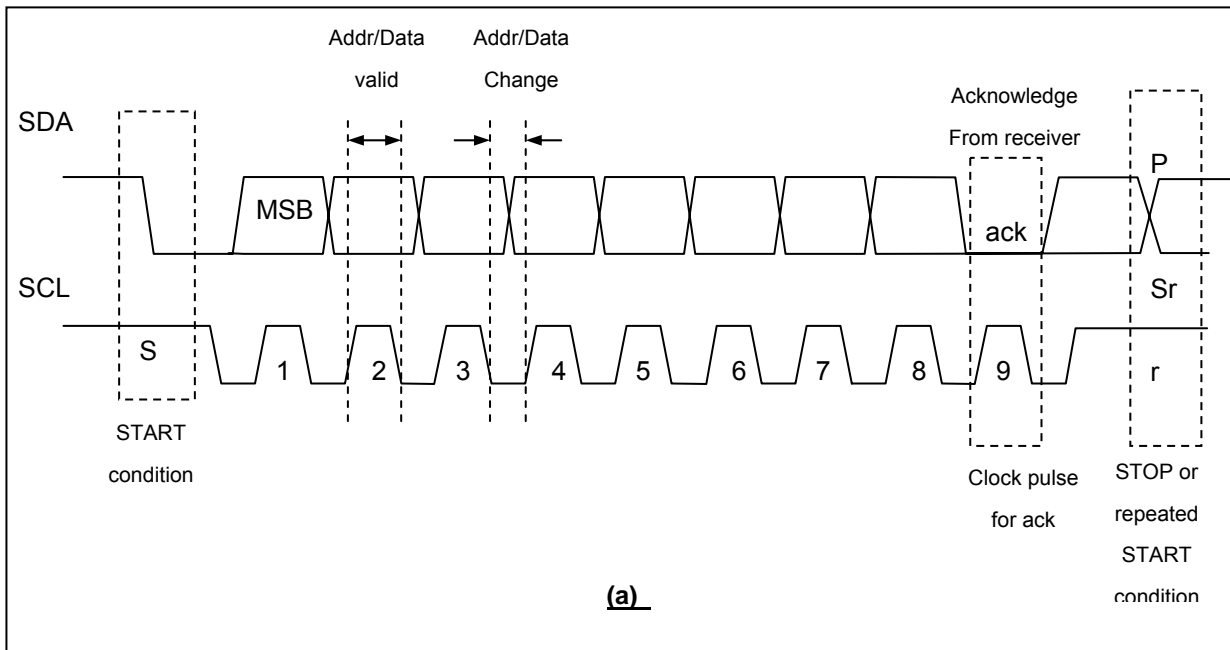

Figure 17-1 I2C-bus Protocol

Figure 17-2 I²C-bus Protocol (cont.)

NOTES:

- 1 Sr means repeated START condition. P means STOP condition.
- 2 In Fig (a), if the master does not generate Sr or P, the next data byte follows the ack.
- 3 In Fig (b), nack is received, the master generates Sr or P and the transfer terminates.

17.4.5 Data Transfer Format

17.4.5.1 First Byte

The first byte is a term indicates the address byte after START condition.

1 Normal 7-bit Address:

After the START condition, the addressing procedure for the I²C-bus is such that the first byte usually determines which slave will be selected by the master.

The first seven bits of the first byte make up the slave address. The eighth bit is the LSB (least significant bit). It determines the direction of the message. A 'zero' in the least significant position of the first byte means that the master will write information to a selected slave. A 'one' in this position means that the master will read information from the slave.

When an address is sent, each device in a system compares the first seven bits after the START condition with its address. If they match, the device considers itself addressed by the master as a slave-receiver or slave-transmitter, depending on the R/W bit.

A slave address can be made-up of a fixed and a programmable part. Since it's likely that there will be several identical devices in a system, the programmable part of the slave address enables the maximum possible number of such devices to be connected to the I²C-bus. The number of programmable address bits of a device depends on the number of pins available. For example, if a device has 4 fixed and 3 programmable address bits, a total of 8 identical devices can be connected to the same bus.

Figure 17-3 Normal 7 Bit Address after START Condition

2 General Call Address:

Address byte with all bits are "0" is defined as "general call address". When this address is used, all devices should, in theory, respond with an acknowledge. However, if a device doesn't need any of the data supplied within the general call structure, it can ignore this address by not issuing an acknowledgment. If a device does require data from a general call address, it will acknowledge this address and behave as a slave-receiver. The second and following bytes will be acknowledged by every slave-receiver capable of handling this data. A slave that cannot process one of these bytes must ignore it by not-acknowledging.

The second byte of the general call address then defines the action to be taken.

Figure 17-4 General Call Address after START Condition

3 START Byte Address:
START Byte:

After the START condition S has been transmitted by the master, data transfer can be preceded by a start procedure which is much longer than normal. The start procedure consists of:

- A START condition (S)
- A START byte (00000001)
- An acknowledge clock pulse (ACK)*
- A repeated START condition (Sr)

NOTE: An acknowledge-related clock pulse is generated after the START byte. This is present only to conform to the byte handling format used on the bus. No device is allowed to acknowledge the START byte.

When the START byte (00000001) is transmitted, another microcontroller (the slave) can therefore sample the SDA line at a low sampling rate (also determined by the I2CGR) until one of the seven zeros in the START byte is detected. After detection of this LOW level on the SDA line, the microcontroller can switch to a higher sampling rate to find the repeated START condition Sr which is then used for synchronization.

Figure 17-5 START Byte after START Condition

17.4.5.2 Transfer Format

A data transfer is always terminated by a STOP condition (P) generated by the master. However, if a master still wishes to communicate on the bus, it can generate a repeated START condition (Sr) and address another slave without first generating a STOP condition. Various combinations of read/write formats are then possible within such a transfer.

Possible data transfer formats are:

- Master-transmitter transmits to slave-receiver. The transfer direction is not changed.
- Master reads slave immediately after first byte. At the moment of the first acknowledge, the master-transmitter becomes a master-receiver and the slave-receiver becomes a slave-transmitter.
- This first acknowledge is still generated by the slave. The STOP condition is generated by the master, which has previously sent a not-acknowledge.

NOTES:

- 1 Combined formats can be used, for example, to control a serial memory. During the first data byte, the internal memory location has to be written. After the START condition and slave address is repeated, data can be transferred.
- 2 All decisions on auto-increment or decrement of previously accessed memory locations etc. are taken by the designer of the device.
- 3 Each byte is followed by an acknowledgment bit as indicated by the 'A' or '!A' blocks in the sequence.

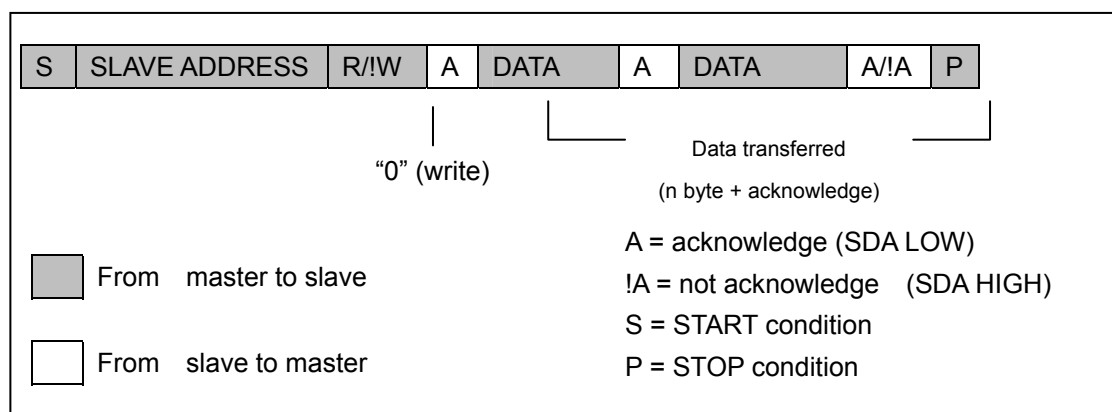

Figure 17-6 A Master-Transmitter Addresses a Slave Receiver with a 7-Bit Address

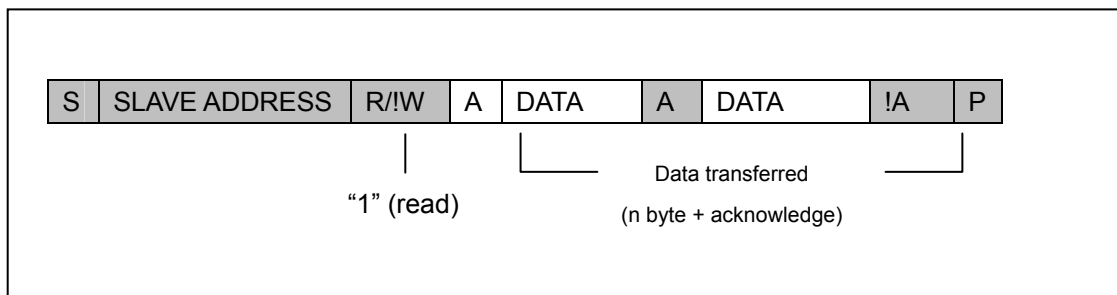

Figure 17-7 A Master Reads the Slave Immediately after the First Byte (Master-Receiver)

17.5 I2C Operation

17.5.1 I2C Initialization

Before transmitting and receiving data, set the I2CE bit in I2CCR to 1 to enable I2C operation and set I2CGR for proper serial clock frequency. Set the I2CE bit to 0 after transmitting or receiving data for low power dissipation.

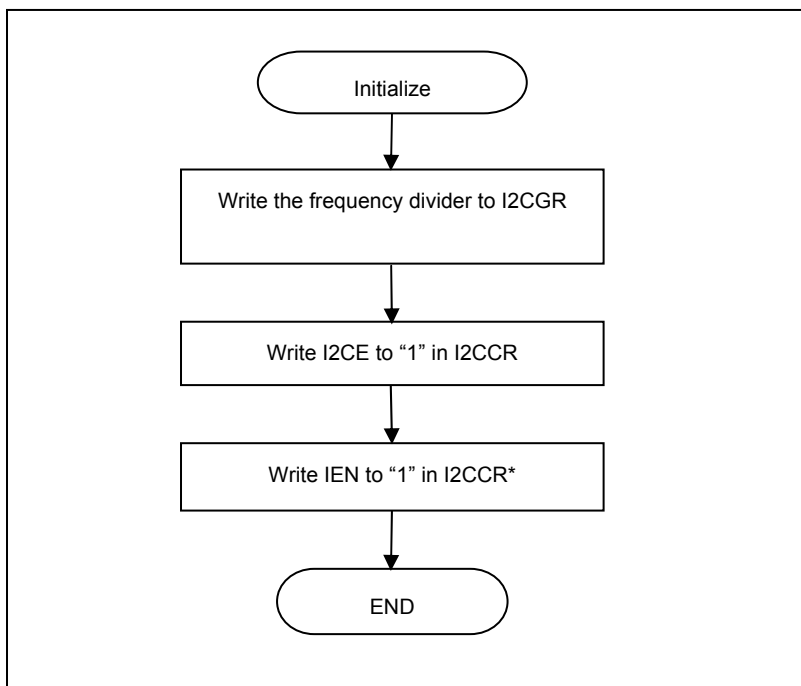

Figure 17-8 I2C Initialization

NOTE: This step is selectable.

17.5.2 Write Operation

Following figure illustrates the flow of a write operation.

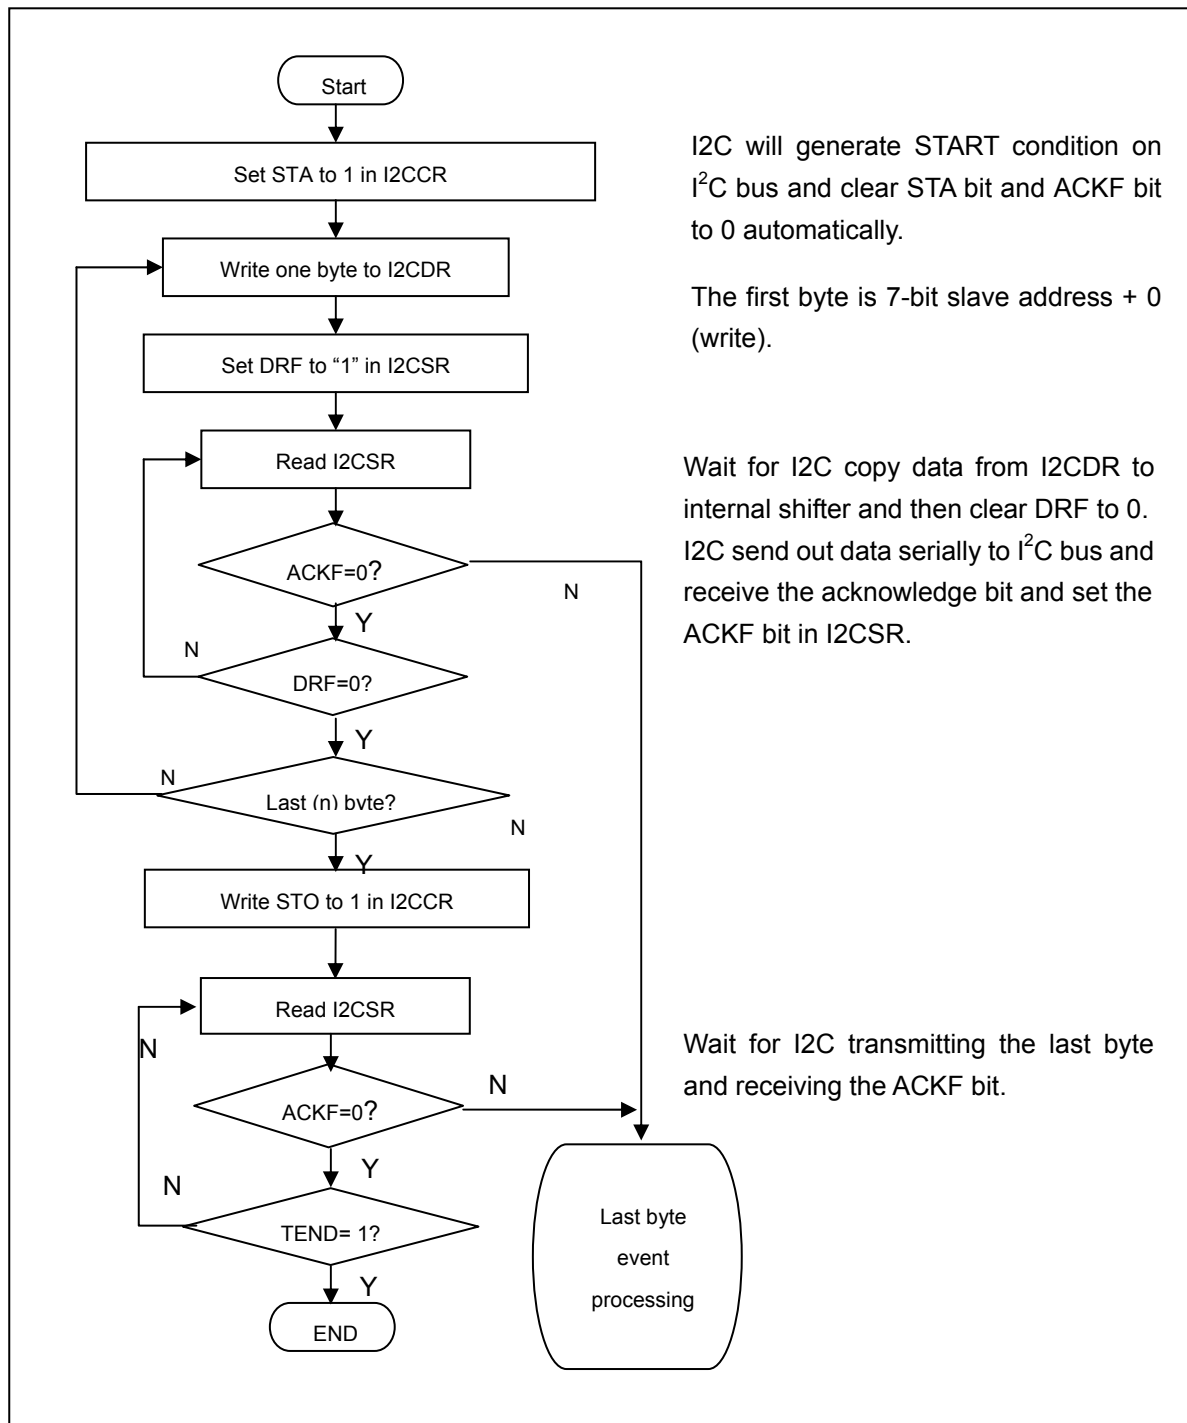

Figure 17-9 I2C Write Operation Flowchart

17.5.3 Read Operation

Following figure illustrates the flow of read operation.

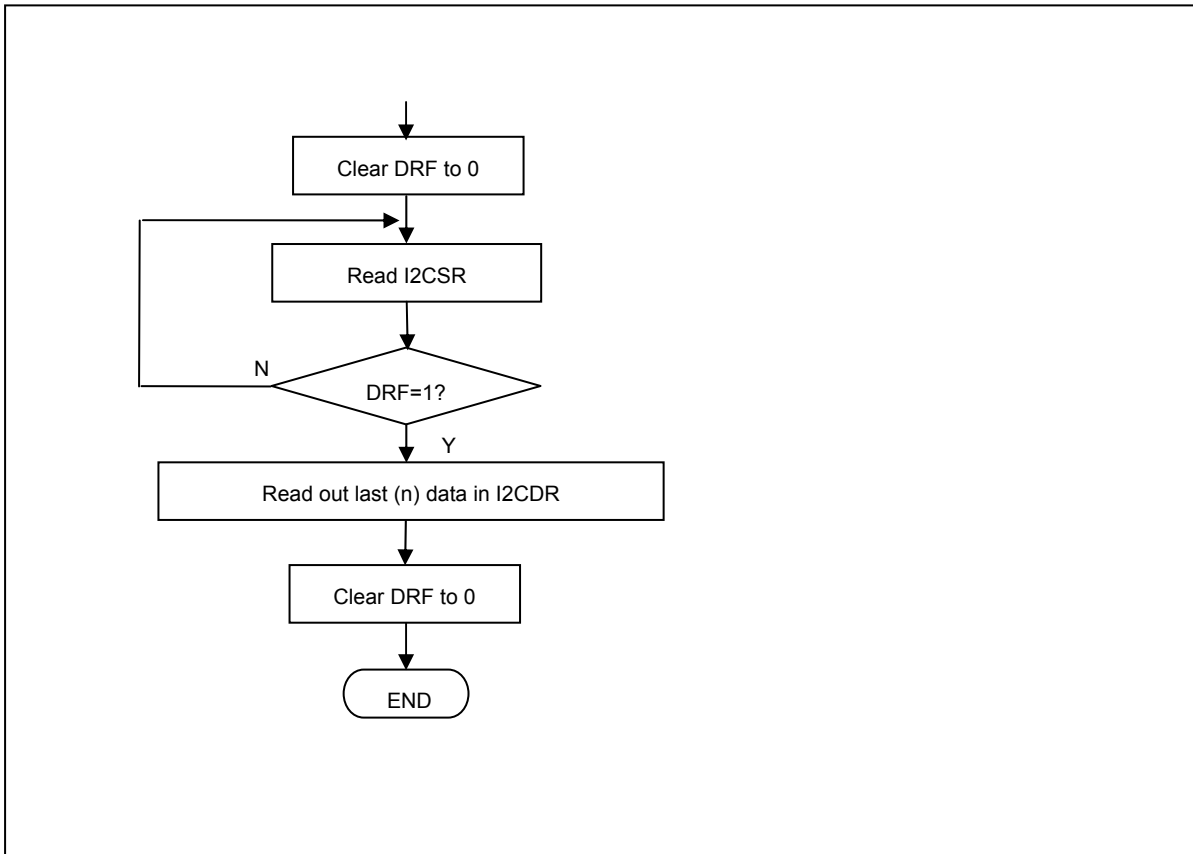

Figure 17-11 Read Operation Flowchart (cont.)

18 USB 2.0 Device Controller

18.1 Overview

The USB 2.0 device controller core provides a USB function controller that has been certified compliant with the USB 2.0 specification for high/full-speed (480/12 Mbps) functions. The core has up to 3 IN endpoints and/or up to 2 OUT endpoints in addition to Endpoint 0.

18.2 Feature

- Support USB Full Speed (12Mb/sec) and High Speed (480Mb/sec)
- Support Control, BULK and Interrupt transfer type
- 3 IN Endpoint Number -- (including EP0, Control, BULKIN, Interrupt)
- 2 OUT Endpoint Number – (including EP0, Control, BULKOUT)
- Support DMA Engine
 - move data between system memory and USB without CPU intervene
- On-chip USB2.0 PHY
- Support Soft Connect/Disconnect
- Support Suspend and Resume Operation

18.3 Functional Description

18.3.1 Block Diagram

18.3.2 Block Description

The Block of USB2.0 device provides a USB 2.0 Transceiver Macrocell Interface to connect to an 8-bit high/full-speed transceiver. The design is also offered with a choice of high-level CPU interfaces. In one implementation, access to the FIFOs and the internal control/status registers is via a 16/32-bit through a 32-bit AHB-compatible interface.

The Block provides all the USB packet encoding, decoding, checking and handshaking – interrupting the CPU only when endpoint data has been successfully transferred.

18.3.2.1 UMTI SYNCHRONIZATION

The role of the UTM Synchronization block is to resynchronize between the transceiver macrocell 60MHz clock domain and the function controller's system clock HCLK, which drives the remainder of the core up to and including the CPU interface. This allows the rest of the Block to run without requiring any further synchronization. The block also performs the High-speed detection handshaking.

18.3.2.2 PACKET ENCODING/DECODING

The Packet Encode/Decode block generates headers for packets to be transmitted and decodes the headers on received packets. It also generates the CRC for packets to be transmitted and checks the CRC on received packets.

18.3.2.3 ENDPOINT CONTROLLERS

Two controller state machines are used: one for control transfers over Endpoint 0, and one for Bulk/Interrupt/Isochronous transactions over Endpoints 1 to 15.

18.3.2.4 CPUINTERFACE

The CPU Interface allows access to the control/status registers and the FIFOs for each endpoint. It also generates interrupts to the CPU when packets are successfully transmitted or received, and when the core enters Suspend mode or resumes from Suspend mode.

18.3.2.5 DMA CONTROLLER

The DMA Controller offer an AHB interface may be configured to include a multi-channel DMA controller. This DMA controller is configurable for up to 8 channels and is intended to promote efficient loading/unloading of the endpoint FIFOs. The DMA controller has its own block of control registers and its own interrupt controller. It supports two modes of operation and each channel can be independently programmed for operating mode.

18.3.2.6 RAM CONTROLLER

The RAM controller provides an interface to a single block of synchronous single-port RAM, which is used to buffer packets between the CPU and USB. It takes the FIFO pointers from the endpoint controllers, converts them to address pointers within the RAM block and generates the RAM access control signals.

18.3.2.7 BIT/ BYTE ORDERING

The Block is intrinsically little-endian, both in bit ordering within a byte and in byte ordering within words.

18.4 Register Description

18.4.1 Register Map

1 Common USB registers (addresses 00h to 0Fh).

These registers provide control and status for the entire function controller.

2 Indexed registers (addresses 10h to 1Fh).

These registers provide control and status for one endpoint. There is an InMaxP and InCSR register for each IN endpoint and an OutMaxP, OutCSR, and OutCount for each OUT endpoint (except for Endpoint 0 which has a reduced registered set: see below).

Only the registers for one IN endpoint and one OUT endpoint appear in the register map at any one time. The endpoints are selected by writing the endpoint number to the Index register.

Therefore to access the registers for IN Endpoint 1 and OUT Endpoint 1, 1 must first be written to the Index register and then the control and status registers appear in the memory map.

3 FIFOs (addresses 20h to 3F/5Fh).

The FIFOs for each IN endpoint appear as a single 16-bit word (if a 16-bit CPU bus is configured) or as a 32-bit double word (if a 32-bit CPU bus is configured) consecutively in the memory map starting at address 20h. The FIFOs for each OUT endpoint also appear consecutively at the same set of addresses. A write to address 22h (24h if a 32-bit CPU bus is configured) results in the word being loaded into the FIFO for IN Endpoint 1. A read of address 22h (24h if a 32-bit CPU bus is configured) results in a word being unloaded from the FIFO for OUT Endpoint 1.

4 Additional Configuration registers (70h–7Fh).

Registers in this area of the memory map provide additional device status information.

5 Non-Indexed Endpoint Control/Status registers (100h and above).

The registers available at 10h–1Fh, accessible independently of the setting of the Index register.

100h–10Fh EP0 registers;

110h–11Fh EP1 registers; 120h–12Fh EP2; and so on.

6 DMA Control Registers (200h and above).

These registers available at 200h and above.

18.4.2 Memory Map

18.4.3 Registers Summary

Common USB Registers				
Name	RW	Reset Value	Address	Access Size
FAddr	RW	0x00	0x13040000	8
Power	RW	0x20	0x13040001	8

Additional Configuration Registers				
Name	RW	Reset Value	Address	Access Size
EPInfo	R	0x??	0x13040078	8
RAMInfo	R	0x??	0x13040079	8

18.4.3.1 FADDR

FAddr is an 8-bit register that should be written with the function’s 7-bit address (received through a SET_ADDRESS descriptor). It is then used for decoding the function address in subsequent token packets.

Bits	Name	Description	RW	
			CPU	USB
7	UPDATE	Set when FAddr is written. Cleared when the new address takes effect (at the end of the current transfer).	R	RC
6:0	Func Addr	The function address.	RW	R

This register should be written with the address value contained in the SET_ADDRESS standard device request (see Universal Serial Bus Specification Revision 2.0, Chapter 9), when it is received on Endpoint 0. The new address will not take effect immediately as the host will still be using the old address for the Status stage of the device request. The Block will continue to use the old address for decoding packets until the device request has completed. The status of the device request can be determined by reading bit 7 of this register. When a new address is written to this register, bit 7 will be automatically set. It will remain high until the device request has completed and will be cleared when the new address takes effect.

NOTE: While the firmware may write the new address to the FADDR register immediately it is received, it is recommended to leave this operation to the Status phase of the operation in case the host aborts the command. Otherwise confusion may arise.

18.4.3.2 POWER

Power is an 8-bit register that is used for controlling Suspend and Resume signaling, and high-speed operation.

POWER		0x13040001							
Bit		7	6	5	4	3	2	1	0
		ISO UP	VER	HS Enab	HS Mode	Reset	Resume	SUSPEND	ENA SUSP
RST		0	0	0	0	0	0	1	0

Bits	Name	Description	RW	
			CPU	USB
7	ISO UPDATE	When set by the CPU, the block will wait for an SOF token from the time InPktRdy is set before sending the packet. If an IN token is received before an SOF token, then a zero length data packet will be sent. NOTE: This bit only affects endpoints performing Isochronous transfers.	RW	R
6	VERSION	Version specific.	RW	R
5	HS ENab	When set by the CPU, the block will negotiate for high-speed mode when the device is reset by the hub. If not set, the device will only operate in Full-speed mode.	RW	R
4	HS Mode	This read-only bit is set when the block has successfully negotiated for High-speed mode.	R	RW
3	Reset	This read-only bit is set when Reset signaling has been detected on the bus (after 2.5 μ s of SE0). It is cleared when either HS negotiation has completed successfully or after 2.1ms of Reset signaling if HS negotiation fails.	R	RW
2	Resume	Set by the CPU to generate Resume signaling when the function is in Suspend mode. The CPU should clear this bit after 10 ms (a maximum of 15 ms) to end Resume signaling.	RW	R
1	Suspend Mode	This read-only bit is set when Suspend mode is entered. It is cleared when the CPU reads the interrupt register, or sets the Resume bit of this register.	R	SET
0	Enable SuspendM	Set by the CPU to enable the SUSPENDM signal.	RW	R

The **ISO Update** bit affects all IN Isochronous endpoints in the CORE. It is normally used as a method of ensuring a “clean” start-up of an IN Isochronous pipe. See the section on IN Isochronous Endpoints (Section 9) for more details on starting up IN Isochronous pipes.

The **HS Enab** bit can be used to disable high-speed operation. Normally the CORE will automatically

negotiate for highspeed operation, when it is reset, by sending a “chirp” to the hub. However if this bit is cleared then the block will not send any “chirps” to the hub so the function will remain in Full-speed mode, even when connected to a high-speed-capable USB.

The **HS Mode** bit can be used to determine whether the block is in High-speed mode or Full-speed mode. It will go high when the function has successfully negotiated for high-speed operation during a USB reset.

The **Reset** bit can be used to determine when reset signaling is present on the USB. It is taken high when Reset signaling is detected and remains high until the bus reverts to an idle state.

The Resume bit is used to force the block to generate Resume signaling on the USB to perform remote wake-up from Suspend mode. Once set high, it should be left high for approximately 10 ms (at least 1 ms and no more than 15 ms), then cleared.

The **Suspend Mode** bit is set by the core when Suspend mode is entered. It will be cleared when the IntrUSB register is read (as a result of receiving a Suspend interrupt). It will also be cleared if Suspend mode is left by setting the Resume bit to initiate a remote wake-up.

The **Enable SuspendM** bit is set to enable the SUSPENDM signal to put the UTM (and any other hardware which uses the SUSPENDM signal) into Suspend mode. If this bit is not set, Suspend mode will be detected as normal but the SUSPENDM signal will remain high so that the UTM does not go into its low-power mode.

18.4.3.3 INTRIN

IntrIn is a 16-bit read-only register that indicates which of the interrupts for IN Endpoints 1 – 15 are currently active. It also indicates whether the Endpoint 0 interrupt is currently active. **NOTE:** Bits relating to endpoints that have not been configured will always return 0. Note also that all active interrupts are cleared when this register is read.

Bits	Name	Description	RW	
			CPU	USB
15	EP15 IN	IN Endpoint 15 interrupt.	R	SET
14	EP14 IN	IN Endpoint 14 interrupt.	R	SET
13	EP13 IN	IN Endpoint 13 interrupt.	R	SET
12	EP12 IN	IN Endpoint 12 interrupt.	R	SET

11	EP11 IN	IN Endpoint 11 interrupt.	R	SET
10	EP10 IN	IN Endpoint 10 interrupt.	R	SET
9	EP9 IN	IN Endpoint 9 interrupt.	R	SET
8	EP8 IN	IN Endpoint 8 interrupt.	R	SET
7	EP7 IN	IN Endpoint 7 interrupt.	R	SET
6	EP7 IN	IN Endpoint 6 interrupt.	R	SET
5	EP5 IN	IN Endpoint 5 interrupt.	R	SET
4	EP4 IN	IN Endpoint 4 interrupt.	R	SET
3	EP3 IN	IN Endpoint 3 interrupt.	R	SET
2	EP2 IN	IN Endpoint 2 interrupt.	R	SET
1	EP1 IN	IN Endpoint 1 interrupt.	R	SET
0	EP0	Endpoint 0 interrupt.	R	SET

18.4.3.4 INTROUT

IntrOut is a 16-bit read-only register that indicates which of the interrupts for OUT Endpoints 1 – 15 are currently active. (Endpoint 0 uses a single interrupt, included in the IntrIn register.) **NOTE:** Bits relating to endpoints that have not been configured will always return 0. Note also that all active interrupts are cleared when this register is read.

Bits	Name	Description	RW	
			CPU	USB
15	EP15 OUT	OUT Endpoint 15 interrupt.	R	SET
14	EP14 OUT	OUT Endpoint 14 interrupt.	R	SET
13	EP13 OUT	OUT Endpoint 13 interrupt.	R	SET
12	EP12 OUT	OUT Endpoint 12 interrupt.	R	SET
11	EP11 OUT	OUT Endpoint 11 interrupt.	R	SET
10	EP10 OUT	OUT Endpoint 10 interrupt.	R	SET
9	EP9 OUT	OUT Endpoint 9 interrupt.	R	SET
8	EP8 OUT	OUT Endpoint 8 interrupt.	R	SET
7	EP7 OUT	OUT Endpoint 7 interrupt.	R	SET
6	EP7 OUT	OUT Endpoint 6 interrupt.	R	SET
5	EP5 OUT	OUT Endpoint 5 interrupt.	R	SET
4	EP4 OUT	OUT Endpoint 4 interrupt.	R	SET
3	EP3 OUT	OUT Endpoint 3 interrupt.	R	SET

2	EP2 OUT	OUT Endpoint 2 interrupt.	R	SET
1	EP1 OUT	OUT Endpoint 1 interrupt.	R	SET
0	Reserved	Always returns 0.	R	R

18.4.3.5 INTRINE

IntrInE is a 16-bit register that provides interrupt enable bits for each of the interrupts in IntrIn. Where a bit is set to 1, MC_NINT will be asserted on the corresponding interrupt in the IntrIn register becoming set. Where a bit is set to 0, the interrupt in IntrIn is still set but MC_NINT is not asserted. On reset, D0 – Dn are set to 1 where n is the number of IN Endpoints (in addition to Endpoint 0) that are included in the design, while the remaining bits are set to 0. **NOTE:** Bits relating to endpoints that have not been configured will always return 0.

Bits	Name	Description	RW	
			CPU	USB
15	EP15 INE	IN Endpoint 15 interrupt enable.	RW	R
14	EP14 INE	IN Endpoint 14 interrupt enable.	RW	R
13	EP13 INE	IN Endpoint 13 interrupt enable.	RW	R
12	EP12 INE	IN Endpoint 12 interrupt enable.	RW	R
11	EP11 INE	IN Endpoint 11 interrupt enable.	RW	R
10	EP10 INE	IN Endpoint 10 interrupt enable.	RW	R
9	EP9 INE	IN Endpoint 9 interrupt enable.	RW	R
8	EP8 INE	IN Endpoint 8 interrupt enable.	RW	R
7	EP7 INE	IN Endpoint 7 interrupt enable.	RW	R
6	EP7 INE	IN Endpoint 6 interrupt enable.	RW	R
5	EP5 INE	IN Endpoint 5 interrupt enable.	RW	R
4	EP4 INE	IN Endpoint 4 interrupt enable.	RW	R
3	EP3 INE	IN Endpoint 3 interrupt enable.	RW	R
2	EP2 INE	IN Endpoint 2 interrupt enable.	RW	R
1	EP1 INE	IN Endpoint 1 interrupt enable.	RW	R
0	EP0 E	Endpoint 0 interrupt enable.	RW	R

18.4.3.6 INTRROUTE

IntrOutE is a 16-bit register that provides interrupt enable bits for each of the interrupts in IntrOut. Where a bit is set to 1, MC_NINT will be asserted on the corresponding interrupt in the IntrOut register becoming set. Where a bit is set to 0, the interrupt in IntrOut is still set but MC_NINT is not asserted. On reset, D1 – Dm are set to 1 where m is the number of OUT Endpoints (in addition to Endpoint 0) that are included in the design, while the remaining bits are set to 0. **NOTE:** Bits relating to endpoints that have not been configured will always return 0.

INTRROUTE		0x13040008																
Bit		15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

18.4.3.7 INTRUSB

IntrUSB is a 4-bit read-only register that indicates which USB interrupts are currently active. **NOTE:** All active interrupts are cleared when this register is read.

Bits	Name	Description	RW	
			CPU	USB
3	SOF	Set at the start of each frame.	R	SET
2	Reset	Set when reset signaling is detected on the bus.	R	SET
1	Resume	Set when resume signaling is detected on the bus while the CORE is in Suspend mode.	R	SET
0	Suspend	Set when suspend signaling is detected on the bus.	R	SET

18.4.3.8 INTRUSBE

IntrUSBE is a 4-bit register that provides interrupt enable bits for each of the interrupts in IntrUSB.

Bits	Name	Description	RW	
			CPU	USB
3	SOF	At the start of each frame interrupt enable.	RW	R
2	Reset	Reset signaling is detected on the bus interrupt enable.	RW	R
1	Resume	Resume signaling is detected on the bus while the core is in Suspend mode interrupt enable.	RW	R
0	Suspend	Suspend signaling is detected on the bus interrupt enable.	RW	R

18.4.3.9 FRAME

Frame is a 16-bit read-only register that holds the last received frame number.

Bits	Name	Description	RW	
			CPU	USB
15:10	Reserved	Always returns 0.	R	W
10:0	Reset	FRAME.	R	W

18.4.3.10 INDEX

Index is a 4-bit register that determines which endpoint control/status registers are accessed at addresses 10h to 19h.

Bits	Name	Description	RW	
			CPU	USB
3:0	INDEX	Selected Endpoint.	RW	R

Each IN endpoint and each OUT endpoint have their own set of control/status registers. Only one set of IN control/status and one set of OUT control/status registers appear in the memory map at any one time. Before accessing an endpoint's control/status registers, the endpoint number should be written to the Index register to ensure that the correct control/status registers appear in the memory map.

18.4.3.11 TESTMODE

Testmode is a 6-bit register that is primarily used to put the CORE into one of the four test modes described in the USB 2.0 specification. It is not used in normal operation.

Bits	Name	Description	RW	
			CPU	USB
5	FORECE_FS	The CPU sets this bit to force the CORE into Full-speed mode when it receives a USB reset.	RW	R
4	FORCE_HS	The CPU sets this bit to force the CORE into High-speed mode when it receives a USB reset.	RW	R
3	TEST_PACKET	The CPU sets this bit to enter the Test_Packet test mode. In this mode, the core – in highspeed mode – repetitively transmits on the bus a 53-byte test packet, the form of which is defined in Section 18.11.4. NOTE: The 53-byte test packet must be loaded into the Endpoint 0 FIFO before the test mode is entered.	RW	R
2	TEST_K	The CPU sets this bit to enter the Test_K test mode. In this mode, the CORE – in high-speed mode – transmits a continuous K on the bus.	RW	R
1	TEST_J	The CPU sets this bit to enter the Test_J test mode. In this mode, the CORE – in high-speed mode – transmits a continuous J on the bus.	RW	R
0	TEST_SE0_NAK	The CPU sets this bit to enter the Test_SE0_NAK test mode. In this mode, the CORE remains in high-speed mode and responds to any valid IN token with a NAK.	RW	R

18.4.3.12 CSR0

CSR0 is an 8-bit register that provides control and status bits for Endpoint 0. **NOTE:** Users should be aware that the value returned when the register is read reflects the status attained e.g. as a result of writing to the register.

Bits	Name	Description	RW	
			CPU	USB
7	ServicedSetupEnd	The CPU writes a 1 to this bit to clear the SetupEnd bit. It is cleared automatically.	SET	R
6	ServicedOutPktRdy	The CPU writes a 1 to this bit to clear the OutPktRdy bit. It is cleared automatically.	SET	R
5	SendStall	The CPU writes a 1 to this bit to terminate the current transaction. The STALL handshake will be transmitted and then this bit will be cleared automatically. NOTE: This behavior differs from that of the SendStall bits associated with additional IN/OUT endpoints which need to be cleared by the CPU.	SET	R
4	SetupEnd	This bit will be set when a control transaction ends before the DataEnd bit has been set. An interrupt will be generated and the FIFO flushed at this time. The bit is cleared by the CPU writing a 1 to the ServicedSetupEnd bit.	R	SET
3	DataEnd	The CPU sets this bit: 1 When setting InPktRdy for the last data packet. 2 When clearing OutPktRdy after unloading the last data packet. 3 When setting InPktRdy for a zero length data packet. It is cleared automatically.	SET	SET

2	SentStall	This bit is set when a STALL handshake is transmitted. The CPU should clear this bit.	RC	R
1	InPktRdy	The CPU sets this bit after loading a data packet into the FIFO. It is cleared automatically when the data packet has been transmitted. An interrupt is generated when the bit is cleared.	RS	R
0	OutPktRdy	This bit is set when a data packet has been received. An interrupt is generated when this bit is set. The CPU clears this bit by setting the ServicedOutPktRdy bit.	R	SET

CSR0 appears in the memory map at address 12h when the Index register is set to 0. It is used for all control/status of Endpoint 0. For details of how to service device requests to Endpoint 0, see Section 6: ‘Endpoint 0 Handling’.

18.4.3.13 COUNT0

Count0 is a 7-bit read-only register that indicates the number of received data bytes in the Endpoint 0 FIFO.

NOTE: The value returned changes as the contents of the FIFO change and is only valid while OutPktRdy (CSR0.D0) is set.

Bits	Name	Description	RW	
			CPU	USB
7:0	COUNT0	Endpoint 0 OUT Count.	R	W

18.4.3.14 INMAXP

The InMaxP register defines the maximum amount of data that can be transferred through the selected IN endpoint in a single operation. There is an InMaxP register for each IN endpoint (except Endpoint 0).

Bits 10:0 define (in bytes) the maximum payload transmitted in a single transaction. The value set can be up to 1024 bytes but is subject to the constraints placed by the USB Specification on packet sizes for Bulk, Interrupt and Isochronous transfers in Fullspeed and High-speed operations.

Where the option of High-bandwidth Isochronous endpoints or of packet splitting on Bulk endpoints has been taken when the core is configured, the register includes either 2 or 5 further bits that define a multiplier m which is equal to one more than the value recorded.

In the case of Bulk endpoints with the packet splitting option enabled, the multiplier m can be up to 32 and defines the maximum number of 'USB' packets (i.e. packets for transmission over the USB) of the specified payload into which a single data packet placed in the FIFO should be split, prior to transfer. (If the packet splitting option is not enabled, D15–D13 is not implemented and D12–D11 (if included) is ignored.) **NOTE:** The data packet is required to be an exact multiple of the payload specified by bits 10:0, which is itself required to be either 8, 16, 32, 64 or (in the case of High Speed transfers) 512 bytes.

For Isochronous endpoints operating in High-Speed mode and with the High-bandwidth option enabled, m may only be either 2 or 3 (corresponding to bit 11 set or bit 12 set, respectively) and it specifies the maximum number of such transactions that can take place in a single microframe. If either bit 11 or bit 12 is non-zero, the CORE will automatically split any data packet written to the FIFO into up to 2 or 3 'USB' packets, each containing the specified payload (or less). The maximum payload for each transaction is 1024 bytes, so this allows up to 3072 bytes to be transmitted in each microframe. (For Isochronous transfers in Fullspeed mode or if High-bandwidth is not enabled, bits 11 and 12 are ignored.)

The value written to bits 10:0 (multiplied by m in the case of high-bandwidth Isochronous transfers) must match the value given in the *wMaxPacketSize* field of the Standard Endpoint Descriptor for the associated endpoint (see *USB Specification Revision 2.0*, Chapter 9). A mismatch could cause unexpected results.

The total amount of data represented by the value written to this register (specified payload $\times m$)

must not exceed the FIFO size for the IN endpoint, and should not exceed half the FIFO size if double-buffering is required.

If this register is changed after packets have been sent from the endpoint, the IN endpoint FIFO should be completely flushed (using the FlushFIFO bit in InCSR) after writing the new value to this register.

18.4.3.15 INCSR

InCSR is a 16-bit register that provides control and status bits for IN transactions through the currently-selected endpoint. There is an InCSR register for each IN endpoint (not including Endpoint 0).

NOTE: Users should be aware that the value returned when the register is read reflects the status attained e.g. as a result of writing to the register.

Bits	Name	Description	RW	
			CPU	USB
15	AutoSet	If the CPU sets this bit, InPktRdy will be automatically set when data of the maximum packet size (value in InMaxP) is loaded into the IN FIFO. If a packet of less than the maximum packet size is loaded, InPktRdy will have to be set manually. NOTE: Should not be set for high-bandwidth Isochronous endpoints.	RW	R
14	ISO	The CPU sets this bit to enable the IN endpoint for Isochronous transfers (ISO mode), and clears it to enable the IN endpoint for Bulk/Interrupt transfers.	RW	R
13	Mode	The CPU sets this bit to enable the endpoint direction as IN, and clears it to enable the endpoint direction as OUT. NOTE: Only valid where the endpoint FIFO is used for both IN and OUT transactions, otherwise ignored.	RW	R
12	DMAReqEnab	The CPU sets this bit to enable the DMA request for the IN endpoint.	RW	R
11	FrcDataTog	The CPU sets this bit to force the endpoint's IN data	RW	R

		toggle to switch after each data packet is sent regardless of whether an ACK was received. This can be used by Interrupt IN endpoints that are used to communicate rate feedback for Isochronous endpoints.		
10	DMAReqMode	The CPU sets this bit to select DMA Request Mode 1 and clears it to select DMA Request Mode 0. NOTE: This bit must not be cleared either before or in the same cycle as the above DMAReqEnab bit is cleared.	RW	R
9:8	–	Unused, always return 0.	R	R
7	IncompTx	When the endpoint is being used for high-bandwidth Isochronous transfers, this bit is set to indicate where a large packet has been split into 2 or 3 packets for transmission but insufficient IN tokens have been received to send all the parts. The remainder of the current packet is then flushed from the FIFO (but any second packet in the FIFO will remain). NOTE: In anything other than a high-bandwidth Isochronous transfer, this bit will always return 0.	RC	SET
6	ClrDataTog	The CPU writes a 1 to this bit to reset the endpoint IN data toggle to 0.	SET	RC
5	SentStall	This bit is set when a STALL handshake is transmitted. The FIFO is flushed and the InPktRdy bit is cleared (see below). The CPU should clear this bit.	RC	SET
4	SendStall	The CPU writes a 1 to this bit to issue a STALL handshake to an IN token. The CPU clears this bit to terminate the stall condition. NOTE: This bit has no effect where the endpoint is being used for Isochronous transfers.	RW	R
3	FlushFIFO	The CPU writes a 1 to this bit to flush the next packet to be transmitted from the endpoint IN FIFO. The FIFO pointer is reset and the InPktRdy bit (below) is cleared. May be set simultaneously with InPktRdy to abort the packet that has just been loaded into the FIFO. NOTE: (i) FlushFIFO should only be set when InPktRdy is set (at other times, it may cause data corruption). (ii) If the FIFO contains two packets, FlushFIFO will need to be set twice to completely clear the FIFO.	SET	R
2	UnderRun	In ISO mode, this bit is set when a zero length data packet is sent after receiving an IN token with the InPktRdy bit not set. In Bulk/Interrupt mode, this bit is set when a NAK is returned in response to an IN token.	RC	SET

		The CPU should clear this bit.		
1	FIFONotEmpty	This bit is set when there is at least 1 packet in the IN FIFO.	RC	SET
0	InPktRdy	The CPU sets this bit after loading a data packet into the FIFO. It is cleared automatically when a data packet has been transmitted. If the FIFO is double-buffered, it is also automatically cleared when there is space for a second packet in the FIFO (see Section 8.1.2). An interrupt is generated (if enabled) when the bit is cleared (suppressed by the built-in DMA controller in DMA Mode 1).	RS	CLEAR

18.4.3.16 OUTMAXP

The OutMaxP register defines the maximum amount of data that can be transferred through the selected OUT endpoint in a single operation. There is an OutMaxP register for each OUT endpoint (except Endpoint 0).

Bits 10:0 define (in bytes) the maximum payload transmitted in a single transaction. The value set can be up to 1024 bytes but is subject to the constraints placed by the USB Specification on packet sizes for Bulk, Interrupt and Isochronous transfers in Fullspeed and High-speed operations.

Where the option of High-bandwidth Isochronous endpoints or of combining Bulk packets has been taken when the core is configured, the register includes either 2 or 5 further bits that define a multiplier *m* which is equal to one more than the value recorded.

For Bulk endpoints with the packet combining option enabled, the multiplier *m* can be up to 32 and defines the number of USB packets of the specified payload which are to be combined into a single data packet within the FIFO. (If the packet splitting option is not enabled, D15–D13 is not implemented and D12–D11 (if included) is ignored.)

For Isochronous endpoints operating in High-Speed mode and with the High-bandwidth option enabled, *m* may only be either 2 or 3 (corresponding to bit 11 set or bit 12 set, respectively) and it specifies the maximum number of such transactions that can take place in a single microframe. If either bit 11 or bit 12 is non-zero, the CORE will automatically combine the separate USB packets received in any microframe into a single packet within the OUT FIFO. The maximum payload for each

transaction is 1024 bytes, so this allows up to 3072 bytes to be received in each microframe. (For Isochronous transfers in Full-speed mode or if High-bandwidth is not enabled, bits 11 and 12 are ignored.)

The value written to bits 10:0 (multiplied by m in the case of high-bandwidth Isochronous transfers) must match the value given in the $wMaxPacketSize$ field of the Standard Endpoint Descriptor for the associated endpoint (see *USB Specification Revision 2.0*, Chapter 9). A mismatch could cause unexpected results.

The total amount of data represented by the value written to this register (specified payload $\times m$) must not exceed the FIFO size for the OUT endpoint, and should not exceed half the FIFO size if double-buffering is required.

18.4.3.17 OUTCSR

OutCSR is a 16-bit register that provides control and status bits for OUT transactions through the currently-selected endpoint. It is reset to 0. **NOTE:** Users should be aware that the value returned when the register is read reflects the status attained e.g. as a result of writing to the register.

Bits	Name	Description	RW	
			CPU	USB
15	AutoClear	If the CPU sets this bit then the OutPktRdy bit will be automatically cleared when a packet of OutMaxP bytes has been unloaded from the OUT FIFO. When packets of less than the maximum packet size are unloaded, OutPktRdy will have to be cleared manually. NOTE: Should not be set for high-bandwidth Isochronous endpoints.	RW	R
14	ISO	The CPU sets this bit to enable the OUT endpoint for Isochronous transfers, and clears it to enable the OUT endpoint for Bulk/Interrupt transfers.	RW	R
13	DMAReqEnab	The CPU sets this bit to enable the DMA request for the OUT endpoint.	RW	R
12	DisNyet Error	Bulk/Interrupt Transactions: The CPU sets this bit to disable the sending of NYET handshakes. When set,	RW	RW

		all successfully received OUT packets are ACK'd including at the point at which the FIFO becomes full. NOTE: This bit only has any effect in High-speed mode, in which mode it should be set for all Interrupt endpoints. ISO Transactions: The core sets this bit to indicate a PID error in the received packet.		
11	DMAReqMode	Two modes of DMA Request operation are supported: DMA Request Mode 0 in which a DMA request is generated for all received packets, together with an interrupt (if enabled); and DMA Request Mode 1 in which a DMA request (but no interrupt) is generated for OUT packets of size OutMaxP bytes and an interrupt (but no DMA request) is generated for OUT packets of any other size. The CPU sets this bit to select DMA Request Mode 1 and clears this bit to select DMA Request Mode 0.	RW	R
10:9	–	Unused, always return 0.	R	R
8	IncompRx	This bit is set in a high-bandwidth Isochronous transfer if the packet in the OUT FIFO is incomplete because parts of the data were not received. It is cleared when OutPktRdy is cleared. NOTE: In anything other than a high-bandwidth Isochronous transfer, this bit will always return 0.	RC	SET
7	ClrDataTog	The CPU writes a 1 to this bit to reset the endpoint data toggle to 0.	SET	RC
6	SentStall	This bit is set when a STALL handshake is transmitted. The CPU should clear this bit.	RC	SET
5	SendStall	The CPU writes a 1 to this bit to issue a STALL handshake to a DATA packet. The CPU clears this bit to terminate the stall condition. NOTE: This bit has no effect where the endpoint is being used for Isochronous transfers.	RW	R
4	FlushFIFO	The CPU writes a 1 to this bit to flush the next packet to be read from the endpoint OUT FIFO. The FIFO pointer is reset and the OutPktRdy bit (below) is cleared. NOTE: FlushFIFO should only be used when OutPktRdy is set. At other times, it may cause data to be corrupted. Note also that, if the FIFO is double-buffered, FlushFIFO may need to be set twice to completely clear the FIFO.	SET	R
3	DataError	This bit is set at the same time that OutPktRdy is set if the data packet has a CRC error. It is cleared when	R	SET

		OutPktRdy is cleared. NOTE: This bit is only valid when the endpoint is operating in ISO mode. In Bulk mode, it always returns zero.		
2	OverRun	This bit is set if an OUT packet arrives while FIFOFull is set i.e. the OUT packet cannot be loaded into the OUT FIFO. The CPU should clear this bit. NOTE: This bit is only valid when the endpoint is operating in ISO mode. In Bulk mode, it always returns zero.	RC	SET
1	FIFOFull	This bit is set when no more packets can be loaded into the OUT FIFO.	R	SET
0	OutPktRdy	This bit is set when a data packet has been received. The CPU should clear this bit when the packet has been unloaded from the OUT FIFO. An interrupt is generated (if enabled) when the bit is set.	RC	SET

18.4.3.18 OUTCOUNT

OutCount is a 13-bit read-only register that holds the number of received data bytes in the packet in the OUT FIFO. **NOTE:** The value returned changes as the contents of the FIFO change and is only valid while OutPktRdy (OutCSR.D0) is set.

Bits	Name	Description	RW	
			CPU	USB
12:0	OUTCOUNT	Endpoint OUT Count.	R	W

18.4.3.19 FIFOx (Addresses 20h – XXh)

This address range provides 16 addresses for CPU access to the FIFOs for each endpoint. Writing to these addresses loads data into the IN FIFO for the corresponding endpoint. Reading from these addresses unloads data from the OUT FIFO for the corresponding endpoint.

If the CPU bus is 16-bit, the address range is 20h – 3Fh and the FIFOs are located on 16-bit word boundaries (Endpoint 0 at 20h, Endpoint 1 at 22h ... Endpoint 15 at 3Eh). If the CPU bus is 32-bit, the address range is 20h – 5Fh and the FIFOs are located on 32-bit double-word boundaries (Endpoint 0

at 20h, Endpoint 1 at 24h ... Endpoint 15 at 5Ch).

NOTE: Transfers to and from FIFOs may be 8-bit, 16-bit, 24-bit or 32-bit as required, and any combination of access is allowed provided the data accessed is contiguous. However, all the transfers associated with one packet must be of the same width so that the data is consistently byte-, word- or double-word-aligned. The last transfer may however contain fewer bytes than the previous transfers in order to complete an odd-byte or odd-word transfer.

18.4.3.20 EPINFO

This 8-bit read-only register allows read-back of the number of IN and OUT endpoints included in the design.

Bits	Name	Description	RW	
			CPU	USB
7:4	OutEndPoint	The number of OUT endpoints implemented in the design.	R	R
3:0	InEndPoint	The number of IN endpoints implemented in the design.	R	R

18.4.3.21 RAMINFO

This 8-bit read-only register provides information about the width of the RAM and the number of DMA channels associated with the built-in DMA controller (where implemented).

Bits	Name	Description	RW	
			CPU	USB
7:4	DMACHans	The number of DMA channels implemented in the design.	R	R
3:0	RAMBITS	The width of the RAM address bus – 1.	R	R

18.5 Programming Scheme

This and the following sections look at the actions that the device controlling the CORE core will need to perform and at the aspects of the operation of the core that affect this.

Throughout this discussion, the controlling device is assumed to be a microcontroller running some firmware but it could be a customized hard-wired logic block.

18.5.1 SOFT CONNECT/DISCONNECT

The core can be configured to allow the connection of the CORE to the USB to be controlled by software.

When the Soft Connect/Disconnect option is selected, the UTMI-compliant PHY used alongside the core can be switched between normal mode and non-driving mode by setting/clearing bit 6 of the Power register (which is then identified as the Soft Conn bit).

When the Soft Conn bit is set to 1, the PHY is placed in its normal mode and the D+/D- lines of the USB bus are enabled. At the same time, the core is placed in 'Powered' state, in which it will not respond to any USB signaling except a USB reset.

When this feature is enabled and the Soft Conn bit is zero, the PHY is put into non-driving mode, D+ and D- are tri-stated and the core appears to the host CPU as if it has been disconnected.

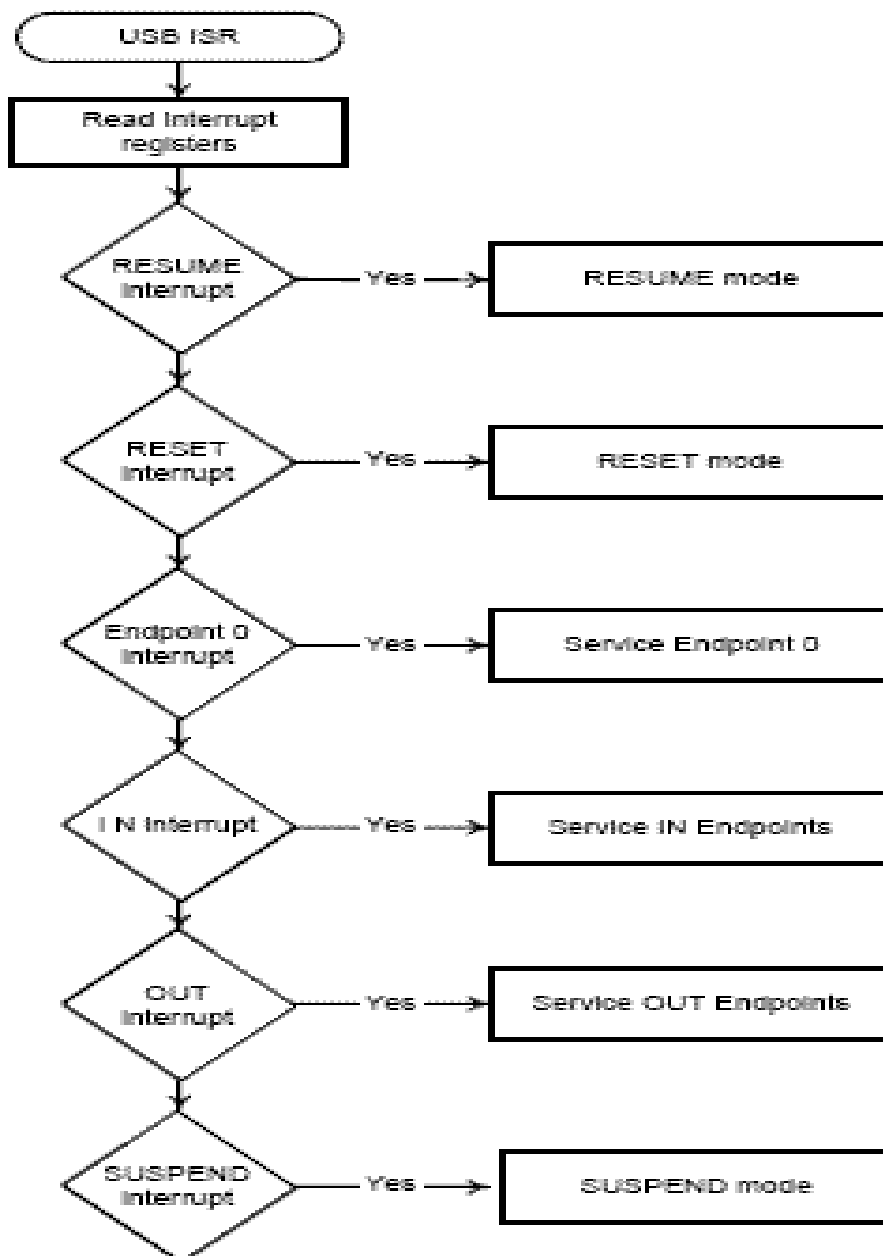

After a hardware reset (NRST = 0), Soft Conn is cleared to 0. The core will therefore appear disconnected until the software has set Soft Conn to 1. The application software can then choose when to set the PHY into its normal mode. Systems with a lengthy initialization procedure may use this to ensure that initialization is complete and the system is ready to perform enumeration before connecting to the USB.

Once the Soft Conn bit has been set to 1, the software can also simulate a disconnect by clearing this bit to 0.

18.5.2 USB INTERRUPT HANDLING

When the CPU is interrupted with a USB interrupt, it needs to read the interrupt status register to determine which endpoint(s) have caused the interrupt and jump to the appropriate routine. If multiple endpoints have caused the interrupt, Endpoint 0 should be serviced first, followed by the other endpoints. The Suspend interrupt should be serviced last.

A flowchart for the USB Interrupt Service Routine is given in as follows:

18.6 USB RESET

When a reset condition is detected on the USB, the CORE performs the following actions:

- 1 Sets FAddr to 0.
- 2 Sets Index to 0.
- 3 Flushes all endpoint FIFOs.
- 4 Clears all control/status registers.
- 5 Enables all endpoint interrupts.
- 6 Generates a Reset interrupt.

If the HS Enab bit in the Power register (D5) was set, the CORE also tries to negotiate for high-speed operation. Whether high-speed operation is selected is indicated by HS Mode bit (Power.D4).

When the software receives a Reset interrupt, it should close any open pipes and wait for bus enumeration to begin.

18.7 SUSPEND/RESUME

When the CORE has no activity on the USB for 3 ms, it will go into Suspend mode. It will also generate a Suspend interrupt (if enabled). At this point, the CORE can then be left active or the application may arrange to disable the USBHSFC by stopping its clock.

The USB may exit Suspend mode by sending Resume signaling on the bus. Alternatively software may perform “Remote wakeup”. How the CORE will respond depends on whether it has been left active or inactive during the suspend.

18.7.1 ACTIVE DURING SUSPEND

When the CORE goes into Suspend mode, the UTM will also be put into Suspend mode by the SUSPENDM line if the Enable SuspendM bit in the Power register (D0) is set. When the CORE remains active, however, it can detect when Resume signaling occurs on the USB. It will then bring the UTM out of Suspend mode and generate a Resume interrupt.

18.7.2 INACTIVE DURING SUSPEND

When the Suspend interrupt described above is received, the software may disable the CORE stopping its clock (this must be done by some external means). However, the CORE will not then be able to detect Resume signaling on the USB.

As a result, external hardware will be needed to detect Resume signaling (by monitoring the LINESTATE lines from the UTM), so that the clock to the CORE can be restarted when this occurs. Appropriate gates could be added to the system design, for example, by specifying that an active high, asynchronous wake-up event is generated when the transceiver is in Suspend mode (SUSPENDM low) and either a K state (linestate == 2'b10 (resume)) or an SE0 (linestate == 2'b00 (reset)) is detected.

18.7.3 REMOTE WAKEUP

If the CORE is in Suspend mode and the software wants to initiate a remote wakeup, it should write to the Power register to set the Resume bit (D2) to 1. (If the clock to the CORE has been stopped, it will need to be restarted before this write can occur.)

The software should leave this bit set for approximately 10 ms (minimum of 2 ms, a maximum of 15 ms) then reset it to 0. By this time the hub should have taken over driving Resume signaling on the USB.

NOTE: No Resume interrupt will be generated when the software initiates a remote wakeup.

18.8 ENDPOINT 0 HANDLING

Endpoint 0 is the main control endpoint of the core. As such, the routines required to service Endpoint 0 are more complicated than those required to service other endpoints.

The software is required to handle all the Standard Device Requests that may be received via Endpoint 0. These are described in Universal Serial Bus Specification, Revision 2.0, Chapter 9. The protocol for these device requests involves different numbers and types of transaction per transfer. To accommodate this, the CPU needs to take a state machine approach to command decoding and handling.

The Standard Device Requests can be divided into three categories: Zero Data Requests (in which all the information is included in the command), Write Requests (in which the command will be followed by additional data), and Read Requests (in which the device is required to send data back to the host).

This section looks at the sequence of events that the software must perform to process the different types of device request.

NOTE: The Setup packet associated with any Standard Device Request should include an 8-byte command. Any Setup packet containing a command field of anything other than 8 bytes will be automatically rejected by the core.

18.8.1 ZERO DATA REQUESTS

Zero data requests have all their information included in the 8-byte command and require no additional data to be transferred. Examples of zero data Standard Device Requests are: SET_FEATURE, CLEAR_FEATURE, SET_ADDRESS, SET_CONFIGURATION, SET_INTERFACE.

The sequence of events will begin, as with all requests, when the software receives an Endpoint 0 interrupt. The OutPktRdy bit (CSR0.D0) will also have been set. The 8-byte command should then be read from the Endpoint 0 FIFO, decoded and the appropriate action taken. For example if the command is SET_ADDRESS, the 7-bit address value contained in the command should be written to the FAddr register.

The CSR0 register should then be written to set the ServicedOutPktRdy bit (D6) (indicating that the command has been read from the FIFO) and to set the DataEnd bit (D3) (indicating that no further data is expected for this request).

When the host moves to the status stage of the request, a second Endpoint 0 interrupt will be generated to indicate that the request has completed. No further action is required from the software: the second interrupt is just a confirmation that the request completed successfully.

If the command is an unrecognized command, or for some other reason cannot be executed, then when it has been decoded, the CSR0 register should be written to set the ServicedOutPktRdy bit (D6)

and to set the SendStall bit (D5). When the host moves to the status stage of the request, the CORE will send a STALL to tell the host that the request was not executed. A second Endpoint 0 interrupt will be generated and the SentStall bit (CSR0.D2) will be set.

If the host sends more data after the DataEnd bit has been set, then the CORE will send a STALL. An Endpoint 0 interrupt will be generated and the SentStall bit (CSR0.D2) will be set.

18.8.2 WRITE REQUESTS

Write requests involve an additional packet (or packets) of data being sent from the host after the 8-byte command. An example of a write Standard Device Request is: SET_DESCRIPTOR.

The sequence of events will begin, as with all requests, when the software receives an Endpoint 0 interrupt. The OutPktRdy bit (CSR0.D0) will also have been set. The 8-byte command should then be read from the Endpoint 0 FIFO and decoded.

As with a zero data request, the CSR0 register should then be written to set the ServicedOutPktRdy bit (D6) (indicating that the command has been read from the FIFO) but in this case the DataEnd bit (D3) should not be set (indicating that more data is expected).

When a second Endpoint 0 interrupt is received, the CSR0 register should be read to check the endpoint status. The OutPktRdy bit (CSR0.D0) should be set to indicate that a data packet has been received. The COUNT0 register should then be read to determine the size of this data packet. The data packet can then be read from the Endpoint 0 FIFO.

If the length of the data associated with the request (indicated by the *wLength* field in the command) is greater than the maximum packet size for Endpoint 0, further data packets will be sent. In this case, CSR0 should be written to set the ServicedOutPktRdy bit, but the DataEnd bit should not be set.

When all the expected data packets have been received, the CSR0 register should be written to set the ServicedOutPktRdy bit and to set the DataEnd bit (indicating that no more data is expected).

When the host moves to the status stage of the request, another Endpoint 0 interrupt will be generated to indicate that the request has completed. No further action is required from the software, the interrupt is just a confirmation that the request completed successfully.

If the command is an unrecognized command, or for some other reason cannot be executed, then when it has been decoded, the CSR0 register should be written to set the ServicedOutPktRdy bit (D6) and to set the SendStall bit (D5). When the host sends more data, the CORE will send a STALL to tell the host that the request was not executed. An Endpoint 0 interrupt will be generated and the SentStall bit (CSR0.D2) will be set.

If the host sends more data after the DataEnd has been set, then the CORE will send a STALL. An

Endpoint 0 interrupt will be generated and the SentStall bit (CSR0.D2) will be set.

18.8.3 READ REQUESTS

Read requests have a packet (or packets) of data sent from the function to the host after the 8-byte command. Examples of read Standard Device Requests are: GET_CONFIGURATION, GET_INTERFACE, GET_DESCRIPTOR, GET_STATUS, SYNCH_FRAME.

The sequence of events will begin, as with all requests, when the software receives an Endpoint 0 interrupt. The OutPktRdy bit (CSR0.D0) will also have been set. The 8-byte command should then be read from the Endpoint 0 FIFO and decoded. The CSR0 register should then be written to set the ServicedOutPktRdy bit (D6) (indicating that the command has read from the FIFO).

The data to be sent to the host should then be written to the Endpoint 0 FIFO. (If required, this data may be transferred using the DMA controller in the AHB bridge in its DMA Mode 0.) If the data to be sent is greater than the maximum packet size for Endpoint 0, only the maximum packet size should be written to the FIFO. The CSR0 register should then be written to set the InPktRdy bit (D1) (indicating that there is a packet in the FIFO to be sent). When the packet has been sent to the host, another Endpoint 0 interrupt will be generated and the next data packet can be written to the FIFO.

When the last data packet has been written to the FIFO, the CSR0 register should be written to set the InPktRdy bit and to set the DataEnd bit (D3) (indicating that there is no more data after this packet). When the host moves to the status stage of the request, another Endpoint 0 interrupt will be generated to indicate that the request has completed. No further action is required from the software: the interrupt is just a confirmation that the request completed successfully.

If the command is an unrecognized command, or for some other reason cannot be executed, then when it has been decoded, the CSR0 register should be written to set the ServicedOutPktRdy bit (D6) and to set the SendStall bit (D5). When the host requests data, the CORE will send a STALL to tell the host that the request was not executed. An Endpoint 0 interrupt will be generated and the SentStall bit (CSR0.D2) will be set.

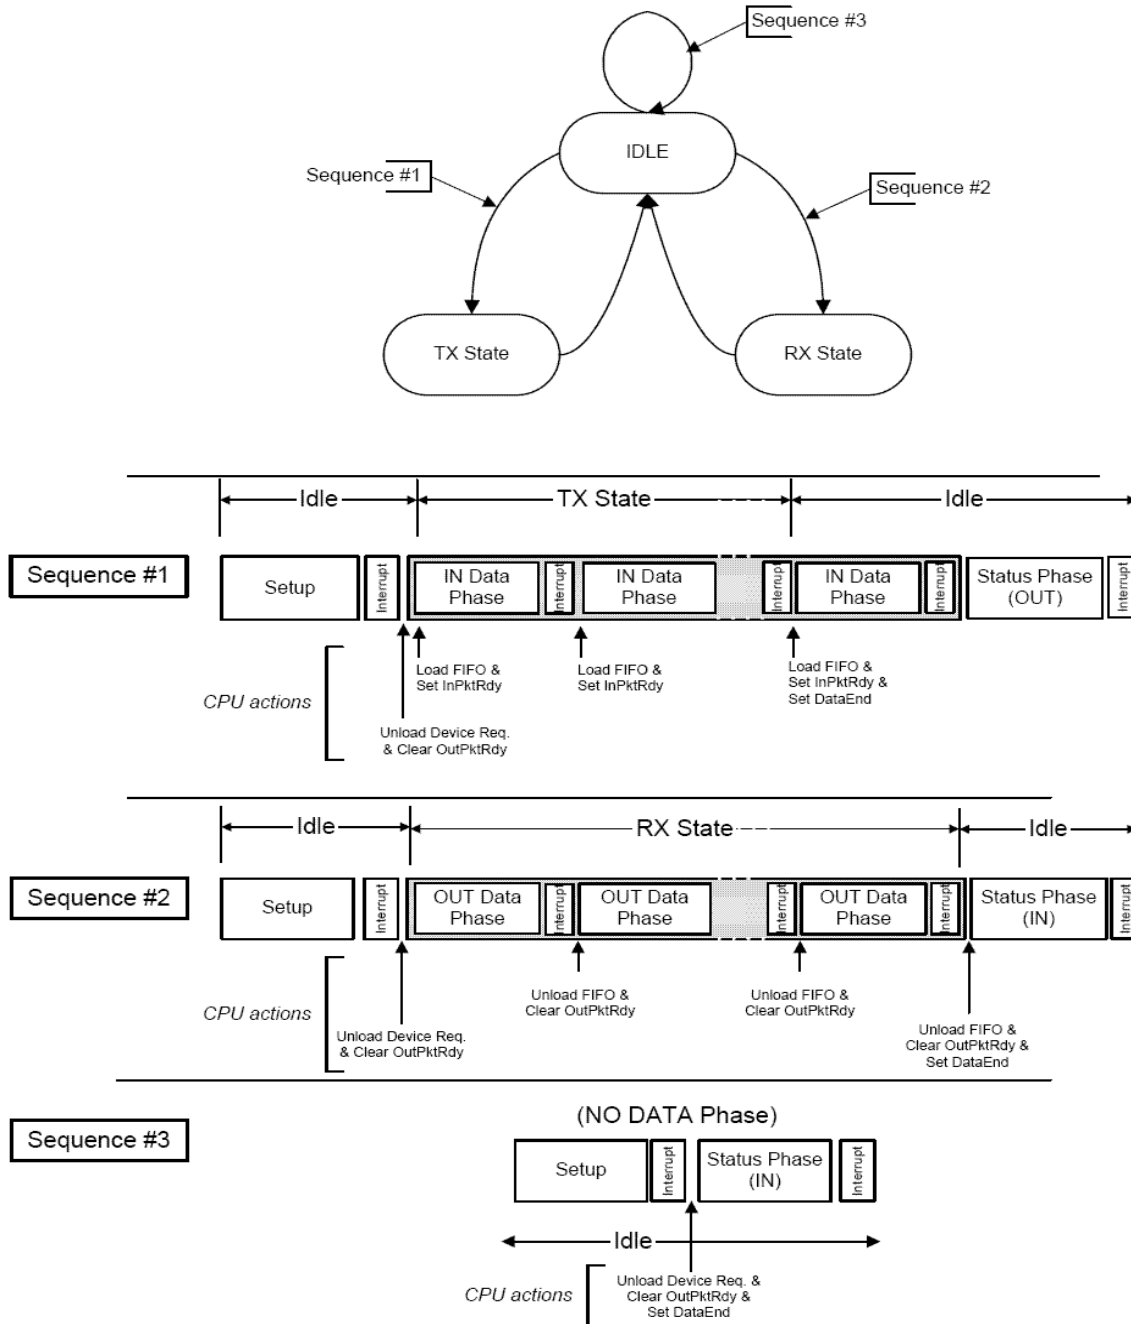

If the host requests more data after the DataEnd has been set, then the CORE will send a STALL. An Endpoint 0 interrupt will be generated and the SentStall bit (CSR0.D2) will be set.

18.8.4 END POINT0 STATES

The Endpoint 0 control needs three modes – IDLE, TX and RX – corresponding to the different phases of the control transfer and the states Endpoint 0 enters for the different phases of the transfer (see Figure 7-1 below).

The default mode on power-up or reset should be IDLE.

OutPktRdy (CSR0.D0) becoming set when Endpoint 0 is in IDLE state indicates a new device request. Once the device request is unloaded from the FIFO, the CORE decodes the descriptor to find whether there is a Data phase and, if so, the direction of the Data phase for the control transfer (in order to set the FIFO direction).

Depending on the direction of the Data phase, Endpoint 0 goes into either TX state or RX state. If there is no Data phase, Endpoint 0 remains in IDLE state to accept the next device request.

The actions that the CPU needs to take at the different phases of the possible transfers (e.g. Loading the FIFO, Setting InPktRdy) are indicated in the diagram on the following page.

Note that the CORE changes the FIFO direction depending on the direction of the Data phase independently of the CPU.

18.8.5 END POINT0 SERVICER OUTLINE

An Endpoint 0 interrupt is generated:

- When the core sets the OutPktRdy bit (CSR0.D0) after a valid token has been received and data has been written to the FIFO.
- When the core clears the InPktRdy bit (CSR0.D1) after the packet of data in the FIFO has been successfully transmitted to the host.
- When the core sets the SentStall bit (CSR0.D2) after a control transaction is ended due to a protocol violation.
- When the core sets the SetupEnd bit (CSR0.D4) because a control transfer has ended before DataEnd (CSR0.D3) is set.

Whenever the Endpoint 0 service routine is entered, the firmware must first check to see if the current control transfer has been ended due to either a STALL condition or a premature end of control transfer. If the control transfer ends due to a STALL condition, the SentStall bit would be set. If the control transfer ends due to a premature end of control transfer, the SetupEnd bit would be set. In either case, the firmware should abort processing the current control transfer and set the state to IDLE.

Once the firmware has determined that the interrupt was not generated by an illegal bus state, the next action taken depends on the Endpoint state.

If Endpoint 0 is in IDLE state, the only valid reason an interrupt can be generated is as a result of the core receiving data from the USB bus. The service routine must check for this by testing the OutPktRdy bit. If this bit is set, then the core has received a SETUP packet. This must be unloaded from the FIFO and decoded to determine the action the core must take. Depending on the command contained within the SETUP packet, Endpoint 0 will enter one of three states:

- If the command is a single packet transaction (SET_ADDRESS, SET_INTERFACE etc) without any data phase, the endpoint will remain in IDLE state.
- If the command has an OUT data phase (SET_DESCRIPTOR etc) the endpoint will enter RX state.
- If the command has an IN data phase (GET_DESCRIPTOR etc) the endpoint will enter TX state.

If the endpoint is in TX state, the interrupt indicates that the core has received an IN token and data from the FIFO has been sent. The firmware must respond to this either by placing more data in the FIFO if the host is still expecting more data or by setting the DataEnd bit to indicate that the data phase is complete. Once the data phase of the transaction has been completed, endpoint 0 should be returned to IDLE state to await the next control transaction.

If the endpoint is in RX state, the interrupt indicates that a data packet has been received. The firmware must respond by unloading the received data from the FIFO. The firmware must then determine whether it has received all of the expected data. If it has, the firmware should set the DataEnd bit and return Endpoint 0 to IDLE state. If more data is expected, the firmware should set the ServicedOutPktRdy bit (CSR0.D6) to indicate that it has read the data in the FIFO and leave the endpoint in RX state.

18.8.6 IDLE MODE

IDLE mode is the mode the Endpoint 0 control needs to select at power-on or reset and is the mode to which the Endpoint 0 control should return when the RX and TX modes are terminated.

18.8.7 TX MODE

When the endpoint is in TX state, all arriving IN tokens need to be treated as part of a Data phase until the required amount of data has been sent to the host. If either a SETUP or an OUT token is received whilst the endpoint is in the TX state, this will cause a SetupEnd condition to occur as the core expects only IN tokens.

Three events can cause TX mode to be terminated before the expected amount of data has been sent:

- The host sends an invalid token causing a SetupEnd condition (CSR0.D4 set).
- The firmware sends a packet containing less than the maximum packet size for Endpoint 0 (MaxP).
- The firmware sends an empty data packet.

Until the transaction is terminated, the firmware simply needs to load the FIFO when it receives an interrupt which indicates that packet has been sent from the FIFO. (An interrupt is generated when InPktRdy is cleared.)

When the firmware forces the termination of a transfer (by sending a short or empty data packet), it should set the DataEnd bit CSR0.D3) to indicate to the core that the Data phase is complete and that the core should next receive an acknowledge packet.

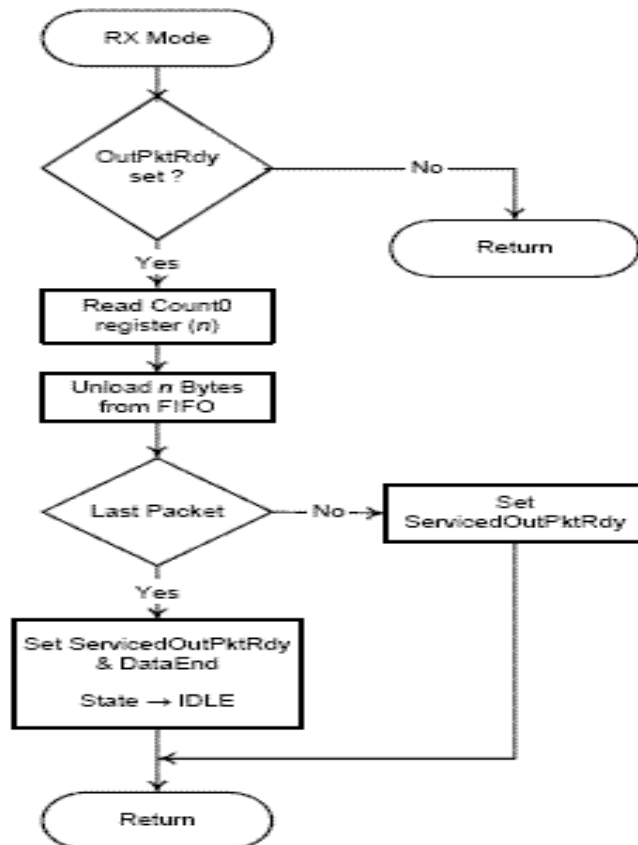

18.8.8 RX MODE

In RX mode, all arriving data should be treated as part of a Data phase until the expected amount of data has been received. If either a SETUP or an IN token is received while the endpoint is in RX state, this will cause a SetupEnd condition to occur as the core expects only OUT tokens.

Three events can cause RX mode to be terminated before the expected amount of data has been received:

- The host sends an invalid token causing a SetupEnd condition (CSR0.D4 set).
- The host sends a packet which contains less than the maximum packet size for Endpoint 0.
- The host sends an empty data packet.

Until the transaction is terminated, the firmware simply needs to unload the FIFO when it receives an interrupt which indicates that new data has arrived (OutPktRdy (CSR0.D0) set) and to clear OutPktRdy by setting the ServicedOutPktRdy bit (CSR0.D6).

When the firmware detects the termination of a transfer (by receiving either the expected amount of data or an empty data packet), it should set the DataEnd bit (CSR0.D3) to indicate to the core that the Data phase is complete and that the core should receive an acknowledge packet next.

18.8.9 ERROR HANDLING

A control transfer may be aborted due to a protocol error on the USB, the host prematurely ending the transfer, or if the function controller software wishes to abort the transfer (e.g. because it cannot process the command).

The CORE will automatically detect protocol errors and send a STALL packet to the host under the following conditions:

- 1 The host sends more data during the OUT Data phase of a write request than was specified in the command. This condition is detected when the host sends an OUT token after the

DataEnd bit (CSR0.D3) has been set.

- 2 *The host request more data during the IN Data phase of a read request than was specified in the command.* This condition is detected when the host sends an IN token after the DataEnd bit in the CSR0 register has been set.
- 3 *The host sends more than MaxP data bytes in an OUT data packet.*
- 4 *The host sends a non-zero length DATA1 packet during the STATUS phase of a read request.*

When the CORE has sent the STALL packet, it sets the SentStall bit (CSR0.D2) and generates an interrupt. When the software receives an Endpoint 0 interrupt with the SentStall bit set, it should abort the current transfer, clear the SentStall bit, and return to the IDLE state.

If the host prematurely ends a transfer by entering the STATUS phase before all the data for the request has been transferred, or by sending a new SETUP packet before completing the current transfer, then the SetupEnd bit (CSR0.D4) will be set and an Endpoint 0 interrupt generated. When the software receives an Endpoint 0 interrupt with the SetupEnd bit set, it should abort the current transfer, set the ServicedSetupEnd bit (CSR0.D7), and return to the IDLE state. If the OutPktRdy bit (CSR0.D0) is set this indicates that the host has sent another SETUP packet and the software should then process this command.

If the software wants to abort the current transfer, because it cannot process the command or has some other internal error, then it should set the SendStall bit (CSR0.D5). The CORE will then send a STALL packet to the host, set the SentStall bit (CSR0.D2) and generate an Endpoint 0 interrupt.

18.9 BULK TRANSACTIONS

18.9.1 BULK IN ENDPOINT

A Bulk IN endpoint is used to transfer non-periodic data from the function controller to the host. Four optional features are available for use with a Bulk IN endpoint:

- **Double packet buffering**

Except where dynamic FIFO sizing is being used, when the value written to the InMaxP register is less than, or equal to, half the size of the FIFO allocated to the endpoint, double packet buffering will be automatically enabled. When enabled, up to two packets can be stored in the FIFO awaiting transmission to the host.

- **DMA**

If DMA is enabled for the endpoint, a DMA request will be generated whenever the endpoint is able to accept another packet in its FIFO. This feature can be used to allow an external DMA controller (such as the one included in the supplied AHB bridge) to load packets into the FIFO without processor intervention. See Section 8.3.

- **AutoSet**

When the AutoSet feature is enabled, the InPktRdy bit (InCSR.D0) will be automatically set when a packet of InMaxP bytes has been loaded into the FIFO. This is particularly useful when DMA is used to load the FIFO as it avoids the need for any processor intervention when loading individual packets during a large Bulk transfer.

- **Automatic Packet Splitting**

For some system designs, it may be convenient for the application software to write larger amounts of data to an endpoint in a single operation than can be transferred in a single USB operation. A particular case in point is where the same endpoint is used for high-speed transfers of 512 bytes under certain circumstances but for full-speed transfers under other circumstances. When operating at full-speed, the maximum amount of data transferred in a single operation is then just 64 bytes. To cater for such circumstances, the CORE includes a configuration option which, if selected, allows larger data packets to be written to Bulk endpoints which are then split into packets of an appropriate (specified) size for transfer across the USB bus. The necessary packet size information is set via the InMaxP register.

18.9.1.1 SETUP

Before using a Bulk IN endpoint the InMaxP register must be written with the maximum packet size (in bytes) for the endpoint. This value should be the same as the *wMaxPacketSize* field of the Standard Endpoint Descriptor for the endpoint. In addition, the relevant interrupt enable bit in the IntrlInE register should be set to 1 (if an interrupt is required for this endpoint), and the high byte of the InCSR register should be set as shown below (Bits D9 – D8 are unused).

When a Bulk IN endpoint is first configured, following a SET_CONFIGURATION or SET_INTERFACE command on Endpoint 0, then the lower byte of InCSR should be written to set the CtrDataTog bit (D6). This will ensure that the data toggle (which is handled automatically by the CORE) starts in the correct state. Also if there are any data packets in the FIFO (indicated by the FIFONotEmpty bit (InCSR.D1) being set), they should be flushed by setting the FlushFIFO bit (InCSR.D3).

NOTE: It may be necessary to set this bit twice in succession if double buffering is enabled.

D15	AutoSet	0/1	Set to 1 if the AutoSet feature is required.
D14	ISO	0	Set to 0 to enable Bulk protocol.
D13	Mode	1	Set to 1 to ensure the FIFO is enabled (only necessary if the FIFO is shared with an OUT endpoint).
D12	DMAReqEnab	0/1	Set to 1 if a DMA request is required for this endpoint. <i>Note:</i> If set to 1, will also need to select the chosen DMAReqMode (InCSR.D10).
D11	FrcDataTog	0	Set to 0 to allow normal data toggle operation.

18.9.1.2 OPERATION

When data is to be transferred over a Bulk IN pipe, a data packet is loaded into the FIFO and the InCSR register written to set the InPktRdy bit (D0). When the packet has been sent, the InPktRdy bit will be cleared by the CORE and an interrupt generated so that the next packet can be loaded into the FIFO. If double packet buffering is enabled (i.e. if the size of the FIFO is at least twice the maximum packet size set in the InMaxP register), then after the first packet has been loaded and the InPktRdy bit set, InPktRdy will be immediately cleared by the CORE and an interrupt generated so that a second packet can be loaded into the FIFO. This means the software can operate the same way, loading a packet when it receives an interrupt, regardless of whether double packet buffering is enabled or not.

In general, the packet size must not exceed the payload specified in the InMaxP register. This defines the maximum packet size (MaxP) for a single transfer over the USB and, for bulk transfers, is required by the USB Specification to be either 8, 16, 32, 64 (Full-Speed or High-Speed) or 512 bytes (High-Speed only). If more than this amount of data is to be transferred, this needs to be sent as multiple USB packets which should all carry the full payload, except for the last packet which holds the residue.

The exception to this rule applies where the automatic Bulk packet splitting option has been selected when the core was configured. Where this option has been selected, packets up to 32 times MaxP can be written to the FIFO (assuming that the FIFO is big enough to accept these larger packets) which are then split by the core into packets of the appropriate size for transfer over the USB. The size of the packets written to the FIFO is given by $m \times \text{payload}$ where $\text{InMaxP}[D15:D11] = m - 1$. All the application software needs to do to take advantage of this feature is to set the appropriate values in the InMaxP register (and ensure that the value written to bits 10:0 matches the value given in the *wMaxPacketSize* field of the Standard Endpoint Descriptor for the associated endpoint). As far as the

application software is concerned, the process of transferring these larger packets is no different from that used to transfer a standard-sized Bulk packet.

The host may determine that all the data for a transfer has been sent by knowing the total size of the data block. Alternatively it may infer that all the data have been sent when it receives a packet which is less than the payload in size. In the latter case, if the total size of the data block is an exact multiple of the payload, it will be necessary for the function to send a null packet after all the data has been sent. This is done by setting `InPktRdy` when the next interrupt is received, without loading any data into the FIFO.

If large blocks of data are being transferred, then the overhead of calling an interrupt service routine to load each packet can be avoided by using DMA.

18.9.1.3 ERROR HANDLING

If the software wants to shut down the Bulk IN pipe, it should set the `SendStall` bit (`InCSR.D4`). When the CORE receives the next IN token, it will send a STALL to the host, set the `SentStall` bit (`InCSR.D5`) and generate an interrupt.

When the software receives an interrupt with the `SentStall` bit (`InCSR.D5`) set, it should clear the `SentStall` bit. It should leave the `SendStall` bit (`InCSR.D4`) set until it is ready to re-enable the Bulk IN pipe. **NOTE:** If the host failed to receive the STALL packet for some reason, it will send another IN token, so it is advisable to leave the `SendStall` bit set until the software is ready to re-enable the Bulk IN pipe.

When a pipe is re-enabled, the data toggle sequence should be restarted by setting the `ClrDataTog` bit in the `InCSR` register (`D6`).

18.9.2 BULK OUT ENDPOINT

A Bulk OUT endpoint is used to transfer non-periodic data from the host to the function controller. Four optional features are available for use with a Bulk OUT endpoint:

- **Double packet buffering**

Except where dynamic FIFO sizing is being used, when the value written to the `OutMaxP` register is less than, or equal to, half the size of the FIFO allocated to the endpoint, double packet buffering will be automatically enabled. When enabled, up to two packets can be stored in the FIFO.
- **DMA**

If DMA is enabled for the endpoint, a DMA request will be generated whenever the endpoint has a packet in its FIFO. This feature can be used to allow an external DMA controller (such as the one included in the supplied AHB bridge) to unload packets from the FIFO without processor

intervention.

- **AutoClear**

When the AutoClear feature is enabled, the OutPktRdy bit (OutCSR.D0) will be automatically cleared when a packet of OutMaxP bytes has been unloaded from the FIFO. This is particularly useful when DMA is used to unload the FIFO as it avoids the need for any processor intervention when unloading individual packets during a large Bulk transfer.

- **Automatic Packet Combining**

For some system designs, it may be convenient for the application software to read larger amounts of data from an endpoint in a single operation than can be transferred in a single USB operation. A particular case in point is where the same endpoint is used for high-speed transfers of 512 bytes under certain circumstances but for full-speed transfers under other circumstances. When operating at full-speed, the maximum amount of data transferred in a single operation is then just 64 bytes. To cater for such circumstances, the CORE includes a configuration option which, if selected, causes the CORE to combine the packets received across the USB bus into larger data packets prior to being read by the application software. The necessary packet.

18.9.2.1 SET UP

Before using a Bulk OUT endpoint, the OutMaxP register must be written with the maximum packet size (in bytes) for the endpoint. This value should be the same as the wMaxPacketSize field of the Standard Endpoint Descriptor for the endpoint. In addition, the relevant interrupt enable bit in the IntrOutE register should be set to 1 (if an interrupt is required for this endpoint) and the high byte of the OutCSR register should be set as shown below: (Bits D10 – D8 are unused/Read-only.)

D15	AutoClear	0/1	Set to 1 if the AutoClear feature is required.
D14	ISO	0	Set to 0 to enable Bulk protocol.
D13	DMAReqEnab	0/1	Set to 1 if a DMA request is required for this endpoint. <i>Note:</i> If set to 1, will also need to select the chosen DMAReqMode (OutCSR.D11).
D12	DisNyet	0	Set to 0 to allow normal PING flow control.

When a Bulk OUT endpoint is first configured, following a SET_CONFIGURATION or SET_INTERFACE command on Endpoint 0, the lower byte of OutCSR should be written to set the ClrDataTog bit (D7). This will ensure that the data toggle (which is handled automatically by the CORE) starts in the correct state. Also if there are any data packets in the FIFO (indicated by the OutPktRdy bit (OutCSR.D0) being set), they should be flushed by setting the FlushFIFO bit (OutCSR.D4).

NOTE: It may be necessary to set this bit twice in succession if double buffering is enabled.

18.9.2.2 OPERATION

When a data packet is received by a Bulk OUT endpoint, the OutPktRdy bit (OutCSR.D0) is set and an interrupt is generated. The software should read the OutCount register for the endpoint to determine the size of the data packet. The data packet should be read from the FIFO, then the OutPktRdy bit should be cleared.

The packets received should not exceed the size specified in the OutMaxP register (because this should match the value set in the *wMaxPacketSize* field of the endpoint descriptor sent to the host). When a block of data larger than *wMaxPacketSize* needs to be sent to the function, it will be sent as multiple packets. All the packets will be *wMaxPacketSize* in size, except the last packet which will contain the residue. The software may use an application specific method of determining the total size of the block and hence when the last packet has been received. Alternatively it may infer that the entire block has been received when it receives a packet which is less than *wMaxPacketSize* in size. (If the total size of the data block is a multiple of *wMaxPacketSize*, a null data packet will be sent after the data to signify that the transfer is complete.)

In general, the application software will need to read each packet from the FIFO individually. The exception to this rule applies where the option for automatic combining of Bulk packets has been selected when the core was configured. Where this option has been selected, the core can receive up to 32 packets at a time and combine them into a single packet within the FIFO (assuming that the FIFO is big enough to accept these larger packets). The size of the packets written to the FIFO is given by $m \times wMaxPacketSize$ where $OutMaxP[D15:D11] = m - 1$. All the application software needs to do to take advantage of this feature is set the appropriate values in the OutMaxP register (and ensure that the value written to bits 10:0 matches the value given in the *wMaxPacketSize* field of the endpoint descriptor). As far as the application software is concerned, the process of transferring these larger packets is no different from that used to transfer a standard-sized Bulk packet.

If large blocks of data are being transferred, the overhead of calling an interrupt service routine to unload each packet can be avoided by using DMA.

18.9.2.3 ERROR HANDLING

If the software wants to shut down the Bulk OUT pipe, it should set the SendStall bit (OutCSR.D5). When the CORE receives the next packet it will send a STALL to the host, set the SentStall bit (OutCSR.D6) and generate an interrupt.

When the software receives an interrupt with the SentStall bit (OutCSR.D6) set, it should clear the SentStall bit. It should leave the SendStall bit (OutCSR.D5) set until it is ready to re-enable the Bulk OUT pipe. **NOTE:** If the host failed to receive the STALL packet for some reason, it will send another packet, so it is advisable to leave the SendStall bit set until the software is ready to re-enable the Bulk OUT pipe. When a Bulk OUT pipe is re-enabled, the data toggle sequence should be restarted by setting the ClrDataTog bit in the OutCSR register (D7).

18.9.2.4 EMPLOYINGDMA

The advantage of employing DMA is that it improves bus and processor utilization when loading or unloading the FIFOs. It is particularly useful when large blocks of data are to be transferred through a Bulk endpoint. The USB protocol requires that large data blocks are transferred by sending a series of packets of the maximum packet size for the endpoint (512 bytes for high speed, 64 bytes for full speed). Only the last packet in the series may be less than the maximum packet size. Indeed, the receiver may use the reception of this 'short' packet to signal the end of the transfer (a null packet may be sent at the end of the series if the size of the data block is an exact multiple of the maximum packet size).

The DMA facilities of the CORE may be used, with a suitably programmed DMA controller, to avoid the overhead of having to interrupt the processor after each individual packet, interrupting the processor only after the transfer has completed.

Versions of the core that use the AHB Interface optionally include a DMA controller, built into the AHB interface. Where the core is configured with the VCI interface, this DMA controller needs to be added by the user. This should be connected to the CPU interface such that DMA accesses appear like normal CPU reads and writes to the CORE.

18.9.2.5 USING DMA WITH BULKINENDPOINTS

For IN endpoints, the DMA request line will go high when the endpoint FIFO is able to accept a data packet. It will either go low when InMaxP bytes have been loaded into the FIFO (or, if the 'Early DMA De-assert' option is selected, while the last 16 bytes are being loaded) – Alternatively, the request line will go low when the InPktRdy bit in InCSR is set.

To use DMA to send a large block of data to the USB host over a Bulk IN endpoint, the DMA controller and CORE should be set up as follows.

The DMA controller should be programmed to perform a burst read of the maximum packet size for the endpoint (512 bytes for high speed, 64 bytes for full speed) when the DMA request line for the endpoint transitions from low to high. Details of the settings to make in the case of the built-in DMA controller are given in Section 12 of the CORE Product Specification. The controller should keep performing these burst reads on each DMA request until the entire data block has been transferred. (The last burst may however be less than the maximum packet size.) It should then interrupt the processor.

The CORE should be programmed to enable AutoSet and DMA Request Mode 1 by setting the AutoSet, DMAReqEnab and DMAReqMode bits in the InCSR register (bits D15, D12 and D10 respectively).

Programmed like this, the CORE will take the DMA request line high whenever there is space in its FIFO to accept a packet. Further, the InPktRdy bit will be automatically set after the DMA controller has

loaded the FIFO with a packet of the maximum packet size. The packet is then ready to be sent to the host. When the last packet has been loaded by the DMA controller, the controller should interrupt the processor. (The built-in controller does this by asserting DMA_NINT.) If the last packet loaded was less than the maximum packet size, the InPktRdy bit will not have been set and will therefore need to be set manually (i.e. by the CPU) to allow the last packet to be sent. The InPktRdy bit will also need to be set manually if the last packet was of the maximum packet size and a null packet is to be sent to indicate the end of the transfer.

18.9.2.6 USING DMA WITH BULK OUT ENDPOINTS

The behavior of the DMA request line for an OUT Endpoint depends on the DMA Request Mode selected through the OutCSR register (D11). In DMA Request Mode 0, the OUT DMA request line goes high when a data packet is available in the endpoint FIFO and goes low either when the last byte of the data packet has been read (or, if the 'Early DMA De-assert' option is selected, just before the last 16 bytes are read from the FIFO) – or when the OutPktRdy bit in OutCSR is cleared. In DMA Request Mode 1, the DMA request line only goes high when the packet received is of the maximum packet size (as set in the OutMaxP register). If the packet received is of some other size, the DMA request line stays low with the result that the packet remains in the FIFO with outPktRdy set. This causes an OUT Endpoint interrupt to be generated (if enabled).

The DMA Request Modes are primarily designed to be used where large packets of data are transferred to a Bulk endpoint. The USB protocol requires such packets to be split into a series of packets of maximum packet size (512 bytes for high speed, 64 bytes for full speed). The last packet in the series may be less than the maximum packet size (or a null packet if the total size of the transfer is an exact multiple of the maximum packet size) and the receiver may interpret this 'short' packet as signaling the end of the transfer. DMA Request Mode 1 can be used, with a suitably programmed DMA controller, to avoid the overhead of having to interrupt the processor after each individual packet – instead just interrupting the processor after the transfer has completed.

NOTE: If the Request Mode is switched from Request Mode 1 to Request Mode 0, the request line will be asserted if there is a packet in the FIFO in order to allow this 'pre-received' packet to be downloaded.

18.9.3 INTERRUPT TRANSACTIONS

18.9.3.1 INTERRUPT IN ENDPOINT

An Interrupt IN endpoint is used to transfer periodic data from the function controller to the host.

An Interrupt IN endpoint uses the same protocol as a Bulk IN endpoint and can be used the same way. However, though DMA can be used, it offers little benefit as Interrupt endpoints are usually expected to transfer all their data in a single packet.

Interrupt IN endpoints also support one feature that Bulk IN endpoints do not, in that they support continuous toggle of the data toggle bit. This feature is enabled by setting the FrcDataTog bit in the InCSR register (D11). When this bit is set to 1, the CORE will consider the packet as having been successfully sent and toggle the data bit for the endpoint, regardless of whether an ACK was received from the host.

18.9.3.2 INTERRUPT OUT END POINT

An Interrupt OUT endpoint is used to transfer periodic data from the host to a function controller.

An Interrupt OUT endpoint uses almost the same protocol as a Bulk OUT endpoint and can be used the same way. The one difference is that Interrupt endpoints do not support PING flow control. This means that the CORE should never respond with a NYET handshake, only ACK/NAK/STALL. To ensure this, the DisNyet bit in the OutCSR register (D12) should be set to 1 to disable the transmission of NYET handshakes in High-speed mode.

Though DMA can be used with an Interrupt OUT endpoint, it generally offers little benefit as Interrupt endpoints are usually expected to transfer all their data in a single packet.

18.11 TESTMODES

The CORE supports the four USB 2.0 test modes defined for High-speed functions. The test modes are entered by writing to the TestMode register (address 0Fh). A test mode is usually requested by the host sending a SET_FEATURE request to Endpoint 0. When the software receives the request, it should wait until the Endpoint 0 transfer has completed (when it receives the Endpoint 0 interrupt indicating that the status phase has completed) then write to the TestMode register.

NOTE: These test modes have no purpose in normal operation.

18.11.1 TESTMODETEST_SE0_NAK

To enter the Test_SE0_NAK test mode, the software should set the Test_SE0_NAK bit by writing 6'h01 to the TestMode register. The CORE will then go into a mode in which it responds to any valid IN token with a NAK.

18.11.2 TESTMODETEST_J

To enter the Test_J test mode, the software should set the Test_J bit by writing 6'h02 to the TestMode register. The CORE will then go into a mode in which it transmits a continuous J on the bus.

18.11.3 TESTMODETEST_K

To enter the Test_K test mode, the software should set the Test_K bit by writing 6'h04 to the TestMode register. The CORE will then go into a mode in which it transmits a continuous K on the bus.

18.11.4 TESTMODETEST_PACKET

To execute the Test_Packet test, the software should first write the standard test packet (shown below) to the Endpoint 0 FIFO and set the InPktRdy bit in the CSR0 register (D1). It should then write 6'h08 to the TestMode register to enter Test_Packet test mode.

The 53 byte test packet to load is as follows (all bytes in hex). The test packet only has to be loaded once, the CORE will keep re-sending the test packet without any further intervention from the software.

19 MultiMediaCard/Secure Digital Controller

19.1 Overview

The MultiMediaCard (MMC) is a universal low cost data storage and communication media that is designed to cover a wide area of applications such as electronic toys, organizers, PDAs, smart phones, and so on. The MMC communication is base on an advanced 7 pin serial bus designed to operate in a low voltage range, at medium speed (20 Mbps).

The Secure Digital (SD) card is an evolution of MMC, with an additional 2 pins and the same form factors. It is specifically designed to meet the security, capacity, performance, and environmental requirements inherent in newly emerging audio and video consumer electronic devices. The physical form factor, pin assignment, and data transfer protocol are forward compatible with the MultiMediaCard with some additions. An SD card can be categorized as SD memory or SD I/O card, commonly known as SDIO. A memory card invokes a copyright protection mechanism that complies with the security of the SDMI standard and is faster and capable of higher memory capacity. The SDIO card provides high-speed data I/O with low-power consumption for mobile electronic devices.

Features of the MultimediaCard/Secure Digital Controller include the following:

- Fully compatible with the *MMC System Specification version 3.3*
- Fully compatible with the *SD Memory Card Specification 1.01* and *SD I/O Specification 1.0* with 1 command channel and 4 data channels
- 20-80 Mbps maximum data rate
- Built-in programmable frequency divider for MMC/SD bus
- Maskable hardware interrupt for SDIO interrupt, internal status and FIFO status
- 16-entry x 32-bit built-in data FIFO
- Password protection of cards
- Multi-SD function support including multiple I/O and combined I/O and memory
- Up to 7 I/O functions plus one memory supported on single SDIO card
- IRQ supported enable card to interrupt MMC/SD controller
- Single or multi block access to the card including erase operation
- Stream access to the card
- Supports SDIO read wait, interrupt detection during 1-bit or 4-bit access
- The maximum block length is 2048 bytes

19.2 Block Diagram

MMC/SD Controller Block Diagram

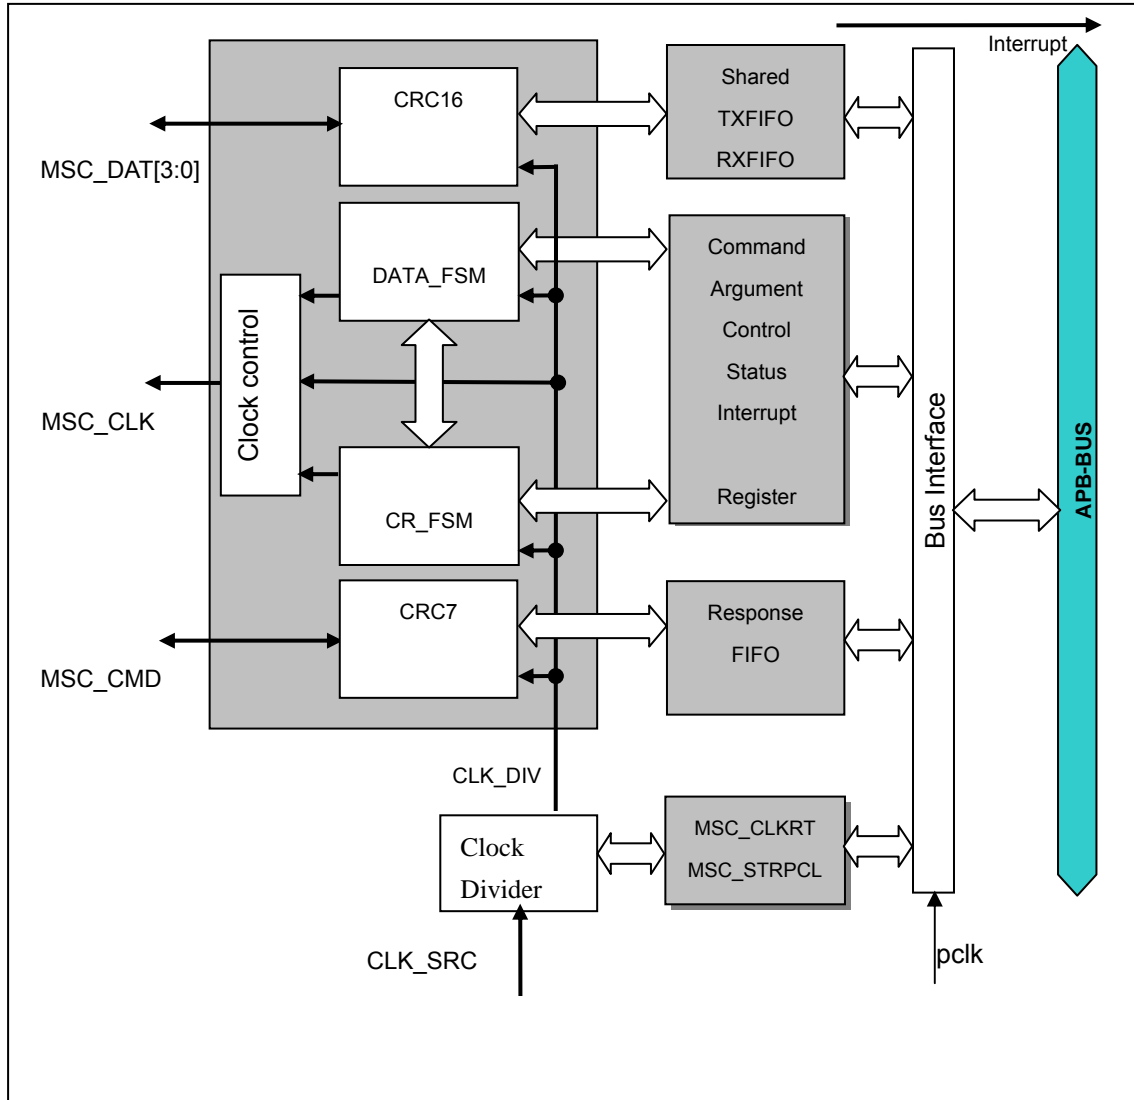

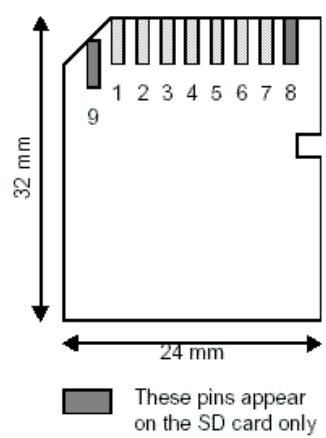

Figure 19-1 MMC/SD Controller Block Diagram

19.3 MMC/SD Controller Signal I/O Description

The MMC and SD cards are 7- or 9- pin cards that operate as external memory storage. The pin assignment and form factor are shown in Table 22-1.

Table 19-1 MMC/SD Controller Signal Description

Form factor and pinout	Pin number	MMC card	SD card	
			1-bit mode	4-bit mode
 <p>32 mm</p> <p>24 mm</p> <p>These pins appear on the SD card only</p>	1	Reserved	Not Used	Data Line [Bit 3]
	2	Command/Response (CMD)		
	3	Supply Voltage Ground (Vss1)		
	4	Supply Voltage (Vdd)		
	5	Clock (CLK)		
	6	Supply Voltage Ground (Vss2)		
	7	Data Line [Bit 0]		
	8		Interrupt (IRQ)	Data Line [Bit 1] or Interrupt (IRQ)
	9		ReadWait(RW)	Data Line [Bit 2] or ReadWait (RW)

MSC and the card communication over the CMD and DATA line is base on command and data bit streams which are initiated by a start bit and terminated by a stop bit.

Command: a command is a token, which starts an operation. A command is sent from MSC either to a single card (addressed command) or to all connected cards (broadcast command). A command is transferred serially on the CMD line. Each command token is preceded by a start bit ('0') and succeeded by an end bit ('1'). The total length is 48 bits and protected by CRC bits.

Table 19-2 Command Token Format

Bit position	47	46	[45 : 40]	[39 : 8]	[7 : 1]	0
Width (bits)	1	1	6	32	7	1
Value	0	1	X	X	x	1
Description	Start bit	Transmission bit	Command index	argument	CRC7	End bit

Response: a response is a token which is sent from an addressed card, or (synchronously) from all connected cards, to MSC as an answer to a previously received command. A response is transferred serially on the CMD line. Response tokens have varies coding schemes depending on their content.

Data: data can be transferred from the card to MSC or vice versa. Data is transferred via the data line. Data transfers to/from the SD Memory Card are done in blocks. Data blocks always succeeded by CRC bits. Single and multiple block operations are defined. Note that the Multiple Block operation mode is better for faster write operation. A multiple block transmission is terminated when a stop command follows on the CMD line. Data transfer can be configured by the MSC to use single or multiple data lines.

Table 19-3 MMC/SD Data Token Format

Description	Start bit	Data	CRC16	End bit
Stream Data	0	X	no CRC	1
Block Data	0	X	X	1

Bits	Name	Description	RW
15:8	Reserved		R
7	EXIT_MULTIPLE	If CMD12 or CMD52 (I/O abort) is to be sent to terminate multiple block read/write in advance, set this bit to 1. 0: No effect 1: Exit from multiple block read/write	W
6	EXIT_TRANSFER	Only used for SDIO suspend/resume and MMC stream read. For SDIO, after suspend is accepted, set this bit with 1. For MMC, after the expected numbers of data are received, set this bit with 1. 0: No effect 1: Exit from multiple block read/write after suspend is accepted, or exit from stream read	W
5	START_READWAIT	Only used for SDIO ReadWait. Start the ReadWait cycle. 0: No effect 1: Start ReadWait	W
4	STOP_READWAIT	Only used for SDIO ReadWait. Stop the ReadWait cycle. 0: No effect 1: Start ReadWait	W
3	RESET	Resets the MMC/SD controller. 0: No effect 1: Reset the MMC/SD controller	W
2	START_OP	This bit is used to start the new operation. When starting the clock, this bit can be 1. When stopping the clock, this bit can only be 0. 0: Do nothing 1: Start the new operation	W
1:0	CLOCK_CONTROL	These bits are used to start or stop clock. 00: Do nothing 01: Stop MMC/SD clock 10: Start MMC/SD clock 11: Reserved	W

19.4.2 MSC Status Register (MSC_STAT)

Bits	Name	Description	RW
31:16	Reserved		R
15	IS_RESETTING	MSC is resetting after power up or MSC_STRPCL[RESET] is written with 1. 0: Reset has been finished 1: Reset has not been finished	R
14	SDIO_INT_ACTIVE	Indicates whether an interrupt is detected at the SD I/O card. A separate acknowledge command to the card is required to clear this interrupt. 0: No interrupt detected 1: The interrupt from SDIO is detected	R
13	PRG_DONE	Indicates whether card has finished programming. 0: Card has not finished programming and is busy 1: Card has finished programming and is not busy	R
12	DATA_TRAN_DONE	Indicates whether data transmission to card has completed. 0: Data transmission to card has not completed 1: Data transmission to card has completed	R
11	END_CMD_RES	End command-response sequence or command sequence. 0: Command and response/no-response sequence has not completed 1: Command and response/no-response sequence has completed	R
10	DATA_FIFO_AFULL	Indicates whether data FIFO is almost full (The number of words \geq 15). For reading data from card, use this bit. 0: Data FIFO is not full 1: Data FIFO is full	R
9	IS_READWAIT	Indicates whether SDIO card has entered ReadWait State.	R

		0: Card has not enter ReadWait 1: Card has enter ReadWait	
8	CLK_EN	Clock enabled. 0: Clock is off 1: Clock is on	R
7	DATA_FIFO_FULL	Indicates whether data FIFO is full. For reading data from card, do not use this bit, because it almost keeps to be 0. 0: Data FIFO is not full 1: Data FIFO is full	R
6	DATA_FIFO_EMPTY	Indicates whether data FIFO is empty. 0: Data FIFO is not empty 1: Data FIFO is empty	R
5	CRC_RES_ERR	Response CRC error. 0: No error on the response CRC 1: CRC error occurred on the response	R
4	CRC_READ_ERROR	CRC read error. 0: No error on received data 1: CRC error occurred on received data	R
3:2	CRC_WRITE_ERROR	CRC write error. 00: No error on transmission of data 01: Card observed erroneous transmission of data 10: No CRC status is sent back 11: Reserved	R
1	TIME_OUT_RES	Response time out. 0: Card response has not timed out 1: Card response has time out	R
0	TIME_OUT_READ	Read time out. 0: Card read data has not timed out 1: Card read data has timed out	R

19.4.3 MSC Clock Rate Register (MSC_CLKRT)

The MSC_CLKRT register specifies the frequency division of the MMC/SD bus clock. The software is responsible for setting this register.

Bits	Name	Description	RW
15:3	Reserved		R
2:0	CLK_RATE	Clock rate. 000: CLK_SRC 001: 1/2 of CLK_SRC 010: 1/4 of CLK_SRC 011: 1/8 of CLK_SRC 100: 1/16 of CLK_SRC 101: 1/32 of CLK_SRC 110: 1/64 of CLK_SRC 111: 1/128 of CLK_SRC	WR

19.4.4 MMC/SD Command and Data Control Register (MSC_CMDAT)

Bits	Name	Description	RW
31:12	Reserved		R
11	IO_ABORT	Specifies the current command is used to abort data transfer. Only used for SDIO.	WR

		0: Nothing 1: The current command is used to abort transfer	
10:9	BUS_WIDTH	Specifies the width of the data bus. 00: 1-bit 01: Reserved 10: 4-bit 11: Reserved	WR
8	DMA_EN	DMA mode enables. When DMA mode is used, this bit is also a mask on RXFIFO_RD_REQ and TXFIFO_WR_REQ interrupts. 0: Program I/O 1: DMA mode	WR
7	INIT	80 initialization clocks. 0: Do not precede command sequence with 80 clocks 1: Precede command sequence with 80 clocks	W
6	BUSY	Specifies whether a busy signal is expected after the current command. This bit is for no data command/response transactions only. 0: Not expect a busy signal 1: Expects a busy signal. If the response is R1b, then set it	WR
5	STREAM_BLOCK	Stream mode. 0: Data transfer of the current command sequence is not in stream mode 1: Data transfer of the current command sequence is in stream mode	WR
4	WRITE_READ	Specifies that the data transfer of the current command is a read or write operation. 0: Specifies that the data transfer of the current command is a read operation 1: Specifies that the data transfer of the current command is a write operation	WR
3	DATA_EN	Specifies whether the current command includes a data transfer. It is also used to reset RX_FIFO and TX_FIFO. 0: No data transfer with current command 1: Has data transfer with current command. It is also used to reset RX_FIFO and TX_FIFO	WR
2:0	RESPONSE_FORMAT	These bit specify the response format for the current command. 000: No response 001: Format R1 and R1b 010: Format R2 011: Format R3 100: Format R4	WR

		101: Format R5 110: Format R6 111: Reserved	
--	--	---	--

19.4.5 MMC/SD Response Time Out Register (MSC_RESTO)

Bits	Name	Description	RW
15:8	Reserved		R
7:0	RES_TO	Specifies the number of MSC_CLK clock counts between the command and when the MMC/SD controller turns on the time-out error for the received response. The default value is 64.	WR

19.4.6 MMC/SD Read Time Out Register (MSC_RDTO)

Bits	Name	Description	RW
15:0	READ_TO	Specifies the number of clocks between the command and when the MMC/SD host controller turns on the time-out error for the received data. The unit is CLK_SRC / 256.	WR

19.4.7 MMC/SD Block Length Register (MSC_BLKLEN)

Bits	Name	Description	RW
15:12	Reserved		R
11:0	BLK_LEN	Specifies the number of bytes in a block, and is normally set to 0x200 for MMC/SD data transactions. The value Specified in the cards CSD.	WR

19.4.8 MSC/SD Number of Block Register (MSC_NOB)

Bits	Name	Description	RW
15:0	NOB	Specifies the number of blocks in a data transfer. One block is a possibility.	WR

19.4.9 MMC/SD Number of Successfully-transferred Blocks Register (MSC_SNOB)

In block mode, the MSC_SNOB register records the number of successfully transferred blocks. If the last block has CRC error, this register also summaries it. It is used to query blocks for multiple block transfer.

Bits	Name	Description	RW
15:0	MSC_SNOB	Specify the number of successfully transferred blocks for a multiple block transfer.	R

19.4.10 MMC/SD Interrupt Mask Register (MSC_IMASK)

Bits	Name	Description	RW
15:8	Reserved		R
7	SDIO	Mask the interrupt from the SD I/O card. 0: Not masked 1: Masked	WR
6	TXFIFO_WR_REQ	Mask the Transmit FIFO write request interrupt. 0: Not masked 1: Masked	WR
5	RXFIFO_RD_REQ	Mask the Receive FIFO read request interrupt. 0: Not masked 1: Masked	WR
4:3	Reserved		R
2	END_CMD_RES	Mask the End command response interrupt. 0: Not masked 1: Masked	WR
1	PRG_DONE	Mask the Programming done interrupt. 0: Not masked 1: Masked	WR
0	DATA_TRAN_DONE	Mask the Data transfer done interrupt. 0: Not masked 1: Masked	WR

19.4.11 MMC/SD Interrupt Register (MSC_IREG)

The MSC_IREG register shows the currently requested interrupt. The FIFO request interrupts, TXFIFO_WR_REQ, and RXFIFO_RD_REQ are masked off with the DMA_EN bit in the MSC_CMDAT register. The software is responsible for monitoring these bit in program I/O mode.

MSC_IREG
0x10021028

Bits	Name	Description	RW
15:8	Reserved		R
7	SDIO	Indicates whether the interrupt from SDIO is detected. 0: The interrupt from SDIO is not detected 1: The interrupt from SDIO is detected	R
6	TXFIFO_WR_REQ	Transmit FIFO write request. Set if data FIFO becomes half empty (the number of words is < 8). 0: No Request for data Write to MSC_TXFIFO 1: Request for data write to MSC_TXFIFO	R
5	RXFIFO_RD_REQ	Receive FIFO read request. Set if data FIFO becomes half full (the number of words is >= 8) or the entries in data FIFO are the last read data. 0: No Request for data read from MSC_RXFIFO 1: Request for data read from MSC_RXFIFO	R
4:3	Reserved		R
2	END_CMD_RES	Indicates whether the command/response sequence has been finished. 0: The command/response sequence has not been finished 1: The command/response sequence has been finished Write 1 to clear.	WR
1	PRG_DONE	Indicates whether card has finished programming. 0: Card has not finished programming and is busy 1: Card has finished programming and is no longer busy Write 1 to clear.	WR
0	DATA_TRAN_DONE	Indicates whether data transfer is done. Note that for stream read/write, only when CMD12 (STOP_TRANS) has been sent, is this bit set. 0: Data transfer is not complete 1: Data transfer has completed or an error has occurred Write 1 to clear.	WR

19.4.12 MMC/SD Command Index Register (MSC_CMD)

Bits	Name	Description	RW
7:6	Reserved		R
5:0	CMD_INDEX	Specifies the command index to be executed.	WR

19.4.13 MMC/SD Command Argument Register (MSC_ARG)

Bits	Name	Description	RW
31:0	ARG	Specifies the argument for the current command.	WR

19.4.14 MMC/SD Response FIFO Register (MSC_RES)

The read-only MMC/SD Response FIFO register (RES_FIFO) holds the response sent back to the MMC/SD controller after every command. The size of this FIFO is 8 x 16-bit. The RES FIFO does not contain the 7-bit CRC for the response. The Status for CRC checking and response time-out status is in the status register, MSC_STAT.

The first halt-word read from the response FIFO is the most significant halt-word of the received response.

Bits	Name	Description	RW
15:0	DATA	Contains the response to every command that is sent by the MMC/SD	R

		controller. The size of this FIFO register is 8 x 16-bit.	
--	--	---	--

19.4.15 MMC/SD Receive Data FIFO Register (MSC_RXFIFO)

The MSC_RXFIFO is used to read the data from a card. It is read-only to the software, and is read on 32-bit boundary. The size of this FIFO is 16 x 32-bit.

Bits	Name	Description	RW
31:0	DATA	One word of read data. The size of this FIFO is 16 x 32-bit.	R

19.4.16 MMC/SD Transmit Data FIFO Register (MSC_TXFIFO)

The MSC_TXFIFO is used to write the data to a card. It is write-only to the software, and is written on 32-bit boundary. The size of this FIFO is 16 x 32-bit.

Bits	Name	Description	RW
31:0	DATA	One word of write data. The size of this FIFO is 16 x 32-bit.	W

19.5 MMC/SD Functional Description

All communication between system and cards is controlled by the MSC. The MSC sends commands of two type: broadcast and addressed (point-to-point) commands.

Broadcast commands are intended for all cards, command like “Go_Idle_State”, “Send_Op_Cond”, “All_send_CID” and “Set_relative_Addr” are using way of broadcasting. During Broadcast mode, all cards are in open-drain mode, to avoid bus contention.

After Broadcast commands “Set_relative_Addr” issue, cards are enter standby mode, and Addressed command will be used from now on, in this mode, CMD/DAT will return to push-pull mode, to have maximum driving for maximum operation frequency.

The MMC and the SD are similar product. Besides the 4x bandwidth and the built-in encryption, they are being programmed similarly.

The MMC/SD controller (MSC) is the interface between the software and the MMC/SD bus. It is responsible for the timing and protocol between the software and the MMC/SD bus. It consists of control and status registers, a 16-bit response FIFO that is 8 entries deep, and one 32-bit receive/transmit data FIFOs that are 16 entries deep. The registers and FIFOs are accessible by the software.

MSC also enable minimal data latency by buffering data and generating and checking CRCs.

19.5.1 MSC Reset

The MMC/SD controller (MSC) can be reset by a hardware reset or software reset. All registers and FIFO controls are set to their default values after any reset.

19.5.2 MSC Card Reset

The command Go_Idle_State, CMD0 is the software reset command for MMC and SD Memory Card, and sets each card into Idle State regardless of the current card state; while in SDIO card, CMD52 is used to write IO reset in CCCR. The cards are initialized with a default relative card address (RCA=0x0000) and with a default driver stage register setting (lowest speed, highest driving current capability).

19.5.3 Voltage Validation

All cards shall be able to establish communication with the host using any operation voltage in the maximal allowed voltage range specified in this standard. However, the support minimum and maximum values for Vdd are defined in Operation Conditions register (OCR) and many not cover the whole range. Cards that store the CID and CSD data in the payload memory would be able to communicate these information only under data transfer Vdd conditions. That means if host and card

have non compatible Vdd ranges, the card will not be able to complete the identification cycle, nor to send CSD data.

Therefore, a special command `Send_Op_cont` (CMD1 for MMC), `SD_Send_Op_Cont` (CMD41 for SD Memory) and `IO_Send_Op_Cont` (CMD5 for SDIO) are designed to provide a mechanism to identify and reject cards which do not match the Vdd range desired by the host. This is accomplished by the host sending the required Vdd voltage window as the operand of this command. Cards which can not perform data transfer in the specified range must discard themselves from further bus operations and go into Inactive State. By omitting the voltage range in the command, the host can query each card and determine the common voltage range before sending out-of-range cards into the Inactive State. This query should be used if the host is able to select a common voltage range or if a notification to the application of non usable cards in the stack is desired.

19.5.4 Card Registry

Card registry on MCC and SD card are different.

For SD card, Identification process start at clock rate `Fod`, while CMD line output drives are push-pull drivers instead of open-drain. After the bus is activated the host will request the cards to send their valid operation conditions. The response to `ACMD41` is the operation condition register of the card. The same command shall be send to all of the new cards in the system. Incompatible cards are sent into Inactive State. The host then issue the command `All_Send_CID` (CMD2) to each card and get its unique card identification (CID) number. Card that is unidentified, that is, which is in Ready State, send its CID number as the response. After the CID was sent by the card it goes into Identification State. Thereafter, the host issues `Send_Relative_Addr` (CMD3) asks the card to publish a new relative card address (RCA), which is shorter that CID and which will be used to address the card in the future data transfer mode. Once the RCA is received the card state changes to the Stand-by State. At this point, if the host wants that the card will have another RCA number, it may ask the card to publish a new number by sending another `Send_Relative_Addr` command to the card. The last published RCA is the actual RCA of the card. The host repeats the identification process, that is, the cycles with CMD2 and CMD3 for each card in the system.

In MMC, the host starts the card identification process in open-drain mode with the identification clock rate `Fod`. The open drain driver stages on the CMD line allow parallel card operation during card identification. After the bus is activated the host will request the cards to send their valid operation conditions (CMD1). The response to CMD1 is the 'wired or' operation on the condition restrictions of all cards in the system. Incompatible cards are sent into Inactive State. The host then issues the broadcast command `All_Send_CID` (CMD2), asking all cards for their unique card identification (CID) number. All unidentified cards, that is, those which are in Ready State, simultaneously start sending their CID numbers serially, while bit-wise monitoring their outgoing bitstream. Those cards, whose outgoing CID bits do not match the corresponding bits on the command line in any one of the bit periods stop sending their CID immediately and must wait for the next identification cycle. Since CID is unique for each card, only one card can be successfully send its full CID to the host. This card then

goes into Identification State. Thereafter, the host issues Set_Relative_Addr (CMD3) to assign to this card a relative card address (RCA). Once the RCA is received the card state changes to the Stand-by State, and the card does not react to further identification cycles, and its output switches from open-drain to push-pull. The host repeat the process, that is CM2 and CMD3, until the host receive time-out condition to recognize completion of the identification process.

19.5.5 Card Access

19.5.5.1 Block Access, Block Write and Block Read

During block write (CMD24-27) one or more blocks of data are transferred from the host to the card with a CRC appended to the end of each block by the host. A card supporting block write shall always be able to accept a block of data defined by WRITE_BL_LEN. If the CRC fails, the card shall indicate the failure on the DAT line; the transferred data will be discarded and not written, and all further transmitted blocks (in multiple block write mode) will be ignored.

Programming of the CID and CSD registers does not require a previous block length setting. The transferred data is also CRC protected. If a part of the CSD or CID register is stored in ROM, then this unchangeable part must match the corresponding part of the receive buffer. If this match fails, then the card will report an error and not change any register contents. Some cards may require long and unpredictable times to write a block of data. After receiving a block of data and completing the CRC check, the card will begin writing and hold the DAT line low if its write buffer is full and unable to accept new data from a new WRITE_BLOCK command. The host may poll the status of the card with a SEND_STATUS command (CMD13) at any time, and the card will respond with its status. The status bit READY_FOR_DATA indicates whether the card can accept new data or whether the write process is still in progress). The host may deselect the card by issuing CMD7 (to select a different card) which will displace the card into the Disconnect State and release the DAT line without interrupting the write operation. When reselecting the card, it will reactivate busy indication by pulling DAT to low if programming is still in progress and the write buffer is unavailable.

Block read is similar to stream read, except the basic unit of data transfer is a block whose maximizes is defined in the CSD (READ_BL_LEN). If READ_BL_PARTIAL is set, smaller blocks whose starting and ending address are entirely contained within one physical block (as defined by READ_BL_LEN) may also be transmitted. Unlike stream read, a CRC is appended to the end of each block ensuring data transfer integrity. CMD17 (READ_SINGLE_BLOCK) initiates a block read and after completing the transfer, the card returns to the Transfer state. CMD18 (READ_MULTIPLE_BLOCK) starts a transfer of several consecutive blocks. Blocks will be continuously transferred until a stop command is issued. If the host uses partial blocks whose accumulated length is not block aligned and block misalignment is not allowed, the card shall detect a block misalignment at the beginning of the first mis-aligned block, set the ADDRESS_ERROR error bit in the status register, abort transmission and wait in the Data State for a stop command.

19.5.5.2 Stream Access, Stream Write and Stream Read (MMC Only)

Stream write (CMD20) starts the data transfer from the host to the card beginning from the starting address until the host issues a stop command. Since the amount of data to be transferred is not determined in advance, CRC can not be used. If the end of the memory range is reached while sending data and no stop command has been sent by the host, all further transferred data is discarded.

There is a stream oriented data transfer controlled by READ_DAT_UNTIL_STOP (CMD11). This command instructs the card to send its payload, starting at a specified address, until the host sends a STOP_TRANSMISSION command (CMD12). The stop command has execution delay due to the serial command transmission. The data transfer stops after the end bit of the stop command. If the end of the memory range is reached while sending data and no stop command has been sent yet by the host, the contents of the further transferred payload is undefined.

19.5.5.3 Erase, Group Erase and Sector Erase (MMC Only)

It is desirable to erase many sectors simultaneously in order to enhance the data throughput. Identification of these sectors is accomplished with the TAG_* commands. Either an arbitrary set of sectors within a single erase group, or an arbitrary selection of erase groups may be erase at one time, but not both together. That is, the unit of measure for determining an erase is either a sector or an erase group. If a set of sectors must be erased, all selected sectors must lie within the same erase group. To facilitate selection, a first command with the starting address is followed by a second command with the final address, and all sectors (or groups) within this range will be selected for erase.

19.5.5.4 Wide Bus Selection/Deselection

Wide Bus (4 bit bus width) operation mode may be selected / deselected using ACMD6. The default bus width after power up or GO_IDLE (CMD0) is 1 bit bus width. ACMD6 command is valid in 'trans state' only. That means the bus width may be changed only after a card was selected (CMD7).

19.5.6 Protection Management

Three write protect methods are supported in the host for Cards, Card internal write protect (Card's responsibility), Mechanical write protect switch (Host responsibility only) and Password protection card lock operation.

19.5.6.1 Card Internal Write Protection

Card data may be protected against either erase or write. The entire card may be permanently write protected by the manufacturer or content provider by setting the permanent or temporary write protect bits in the CSD. For cards which support write protection of groups of sectors by setting the WP_GRP_SIZE sectors as specified in the CSD), and the write protection may be changed by the application. The SET_WRITE_PROT command sets the write protection of the addressed

write-protect group, and the CLR_WRITE_PROT command clears the write protection of the addressed write-protect group.

The SEND_WRITE_PROT command is similar to a single block read command. The card shall send a data block containing 32 write protection bits (representing 32 write protect groups starting at the specified address) followed by 16 CRC bits. The address field in the write protect commands is a group address in byte units. The card will ignore all LSB's below the group size.

19.5.6.2 Mechanical write protect switch

A mechanical sliding tablet on the side of the card will be used by the user to indicate that a given card is write protected or not. If the sliding tablet is positioned in such a way that the window is open that means the card is write protected. If the window is close the card is not write protected.

A proper, matched, switch on the socket side will indicated to the host that the card is write protected or not. It is the responsibility of the host to protect the card. The position of the write protect switch is un-known to the internal circuitry of the card.

19.5.6.3 Password Protect

The password protection feature enables the host to lock a card while providing a password, which later will be used for unlocking the card. The password and its size is kept in an 128-bit PWD and 8-bit PWD_LEN registers, respectively. These registers are non-volatile so that a power cycle will not erase them.

Locked cards respond to (and execute) all commands in the basic command class (class 0) and "lock card" command class. Thus the host is allowed to reset, initialize, select, query for status, etc., but not to access data on the card. If the password was previously set (the value of PWD_LEN is not 0) will be locked automatically after power on. Similar to the existing CSD and CID register write commands the lock/unlock command is available in "trans_state" only. This means that it does not include an address argument and the card must be selected before using it. The card lock/unlock command has the structure and bus transaction type of a regular single block write command. The transferred data block includes all the required information of the command (password setting mode, PWD itself, card lock/unlock etc.). The following table describes the structure of the command data block.

Table 19-5 Command Data Block Structure

Byte #	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	Rsv	Rsv	Rsv	Rsv	ERASE	LOCK_UNLOCK	CLR_PWD	SET_PWD
1	PWDS_LEN							
2	Password Data							
...								

PWDS_LEN + 1	
-----------------	--

ERASE – 1: Defines Forced Erase Operation (all other bits shall be 0) and only the command byte is sent.

LOCK/UNLOCK – 1=Locks the card. 0=Unlock the card (note that it is valid to set this bit together with SET_PWD but it is not allowed to set it together with CLR_PWD).

CLR_PWD – 1=Clears PWD.

SET_PWD – 1=Set new password to PWD.

PWD_LEN: Defines the following password length (in bytes).

PWD: The password (new or currently used depending on the command).

The data block size shall be defined by the host before it send the card lock/unlock command. This will allow different password sizes.

The following paragraphs define the various lock/unlock command sequences:

Lock command sequences:

- 1 Setting the Password.
 - a Select a card (CMD7), if not previously selected already.
 - b Define the block length (CMD16), given by the 8bit card lock/unlock mode, the 8 bits password size (in bytes), and the number of bytes of the new password. In case that a password replacement is done, then the block size shall consider that both passwords, the old and the new one, are sent with the command.
 - c Send Card Lock/Unlock command with the appropriate data block size on the data line including 16-bit CRC. The data block shall indicate the mode (SET_PWD), the length (PWD_LEN) and the password itself. In case that a password replacement is done, then the length value (PWD_LEN) shall include both passwords, the old and the new one, and the PWD field shall include the old password (currently used) followed by the new password.
 - d In case that the sent old password is not correct (not equal in size and content) then LOCK_UNLOCK_FAILED error bit will be set in the status register and the old password does not change. In case that PWD matches the sent old password then the given new password and its size will be saved in the PWD and PWD_LEN fields, respectively.

Note that the password length register (PWD_LEN) indicates if a password is currently set. When it equals 0 there is no password set. If the value of PWD_LEN is not equal to zero the card will lock itself after power up. It is possible to lock the card immediately in the current power session by setting the LOCK/UNLOCK bit (while setting the password) or sending additional command for card lock.

- 2 Reset the password.
 - a Select a card (CMD7), if not previously selected already.
 - b Define the block length (CMD16), given by the 8-bit card lock/unlock mode, the 8-bit

password size (in bytes), and the number of bytes of the currently used password.

- c Send the card lock/unlock command with the appropriate data block size on the data line including 16-bit CRC. The data block shall indicate the mode CLR_PWD, the length (PWD_LEN) and the password (PWD) itself (LOCK/UNLOCK bit is don't care). If the PWD and PWD_LEN is set to 0. If the password is not correct then the LOCK_UNLOCK_FAILED error bit will be set in the status register.

3 Locking a card.

- a Select a card (CMD7), if not previously selected already.
- b Define the block length (CMD16), given by the 8-bit card lock/unlock mode, the 8-bit password size (in bytes), and the number of bytes of currently used password.
- c Send the card lock/unlock command with the appropriate data block size on the data line including 16-bit CRC. The data block shall indicate the mode LOCK, the length (PWD_LEN) and the password (PWD) itself.

If the PWD content equals to the sent password then the card will be locked and the card-locked status bit will be set in the status register. If the password is not correct then LOCK_UNLOCK_FAILED error bit will be set in the status register.

Note that it is possible to set the password and to lock the card in the same sequence. In such case the host shall perform all the required steps for setting the password (as described above) including the bit LOCK set while the new password command is sent. If the password was previously set (PWD_LEN is not 0), then the card will be locked automatically after power on reset. An attempt to lock a locked card or to lock a card that does not have a password will fail and the LOCK_UNLOCK_FAILED error bit will be set in the status register.

Unlock command sequences:

1 Unlocking the card.

- a Select a card (CMD7), if not previously selected already.
- b Define the block length (CMD16), given by the 8-bit card lock/unlock mode, the 8-bit password size (in bytes), and the number of bytes of the currently used password.
- c Send the card lock/unlock command with the appropriate data block size on the data line including 16-bit CRC. The data block shall indicate the mode UNLOCK, the length (PWD_LEN) and the password (PWD) itself.

If the PWD content equals to the sent password then the card will be unlocked and the card-locked status bit will be cleared in the status register. If the password is not correct then the LOCK_UNLOCK_FAILED error bit will be set in the status register.

Note that the unlocking is done only for the current power session. As long as the PWD is not cleared the card will be locked automatically on the next power up. The only way to unlock the card is by clearing the password. An attempt to unlock an unlocked card will fail and LOCK_UNLOCK_FAILED error bit will be set in the status register.

2 Forcing Erase.

In case that the user forgot the password (the PWD content) it is possible to erase all the card data content along with the PWD content. This operation is called Forced Erase.

- a Select a card (CMD7), if not previously selected already.
- b Define the block length (CMD16) to 1 byte (8bit card lock/unlock command). Send the card lock/unlock command with the appropriate data block of one byte on the data line including 16-bit CRC. The data block shall indicate the mode ERASE (the ERASE bit shall be the only bit set).

If the ERASE bit is not the only bit in the data field then the LCOK_UNLOCK_FAILED error bit will be set in the status register and the erase request is rejected. If the command was accepted then ALL THE CARD CONTENT WILL BE ERASED including the PWD and PWD_LEN register content and the locked card will get unlocked.

An attempt to force erase on an unlocked card will fail and LOCK_UNLOCK_FAILED error bit will be set in the status register.

19.5.7 Card Status

The response format R1 contains a 32-bit field named card status. This field is intended to transmit the card's status information (which may be stored in a local status register) to the host. If not specified otherwise, the status entries are always related to the previous issued command.

Table below defines the different entries of the status. The type and clear condition fields in the table are abbreviate as follows:

Type:

- E: Error bit.
- S: Status bit.
- R: Detected and set for the actual command response.
- X: Detected and set during command execution. The host must poll the card by issuing the status command in order to read these bits.

Clear Condition:

- A: According to the card current state.
- B: Always related to the previous command. Reception of a valid command will clear it (with a delay of one command).
- C: Clear by read.

Table 19-6 Card Status Description

Bits	Identifier	Type	Description	Clear Condition
31	OUT_OF_RANGE	E R	The command's argument was out of the allowed range for this card. 0: No Error 1: Error	C
30	ADDRESS_ERROR	E R X	A misaligned address which did not match the block length was used in the command. 0: No Error 1: Error	C
29	BLOCK_LEN_ERROR	E R	The transferred block length is not allowed for this, or the number of transferred bytes does not match the block length. 0: No Error 1: Error	C
28	ERASE_SEQ_ERROR	E R	An error in the sequence of erase commands occurred. 0: No Error 1: Error	C
27	ERASE_PARAM	E X	An invalid selection of sectors or groups for erase occurred. 0: No Error 1: Error	C
26	WP_VIOLATION	E R X	Attempt to program a write protected block. 0: No Protected 1: Protected	C
25	CARD_IS_LOCKED	S X	When set, signals that the card is locked by the host. 0: Card unlocked 1: Card locked	A
24	LOCK_UNLOCK_FAILED	E R X	Set when a sequence or password error has been detected in lock/unlock card command or if there was an attempt to access a locked card. 0: No Error 1: Error	C

23	COM_CRC_ERROR	E R	The CRC check of the previous command failed. 0: No Error 1: Error	B
22	ILLEGAL_COMMAND	E R	Command not legal for the card state. 0: No Error 1: Error	B
21	CARD_ECC_FAILED	E X	Card internal ECC was applied but failed to correct the data. 0: normal 1: failure	C
20	CC_ERROR	E R X	Internal card controller error. 0: No Error 1: Error	C
19	ERROR	E R X	A general or an unknown error occurred during the operation. 0: No Error 1: Error	C
18	UNDERRUN	E X	The card could not sustain data transfer in stream read mode. 0: No Error 1: Error	C
17	OVERRUN	E X	The card could not sustain data programming in stream write mode. 0: No Error 1: Error	C
16	CID/CSD_OVERWRITE	E R X	Can be either one of the following errors. 0: No Error 1: Error	C
15	WP_ERASE_SKIP	S X	Only partial address space was erased due to existing write protected blocks. 0: No Protected 1: Protected	C
14	CARD_ECC_DISABLED	S X	The command has been executed without using the internal ECC. 0: enabled 1: disabled	A

13	ERASE_RESET	S R	An erase sequence was cleared before executing because an out of erase sequence command was received. 0: normal 1: set	C
12:9	CURRENT_STATE	S X	The state of the card when receiving the command. If the command execution causes a state change, it will be visible to the host in the response to the next command. The four bits are interpreted as binary coded number between 0 and 15. 0: idle 1: ready 2: ident 3: stby 4: tran 5: data 6: rcv 7: prg 8: dis (9 – 15): rsv	B
8	READY_FOR_DATA	S X	Corresponds to buffer empty signaling on the bus. 0: No Ready 1: Ready	A
7:6	Reserved	-	-	-
5	APP_CMD	S R	The card will expect ACMD, or indication that the command has been interpreted as ACMD. 0: Disable 1: Enable	C
4:0	Reserved	-	-	-

19.5.8 SD Status

The SD status contains status bits that are related to the SD card proprietary features and may be used for future application specific usage. The size of the SD status is one data block of 512bit. The content of this register is transmitted to the Host over the DAT bus along with 16-bit CRC. The SD status is sent to the host over the DAT bus if ACMD13 is sent (CMD55 followed with CMD13). ACMD13 can be sent to a card only in 'tran_state' (card is selected). SD status structure is described in below.

The same abbreviation for *type* and *clear condition* were used as for the Card Status above.

Table 19-7 SD Status Structure

Bits	Identifier	Type	Description	Clear Condition
511:510	DAT_BUS_WIDTH	S R	Shows the currently defined data bus width that was defined by SET_BUS_WIDTH command. 00: 1 (default) 01: Reserved 10: 4 bit width 11: Reserved	A
509	SECURED_MODE	S R	Card is in Secured Mode of operation. 00: Not in the Mode 10: In the mode	A
508:496	Reserved.			
495:480	SD_CARD_TYPE	S R	All 0, is SD Memory cards.	A
479:448	SIZE_OF_PROTECTED_AREA	S R	Size of protected area.	A
447:312	Reserved.			
311:0	Reserved for manufacturer.			

19.5.9 SDIO

I/O access differs from memory in that the registers can be written and read individually and directly without a FAT file structure or the concept of blocks (although block access is supported). These registers allow access to the IO data, control of the IO function, and report on status or transfer I/O data to and from the host.

Each SDIO card may have from 1 to 7 functions plus one memory function built into it. A function is a self contained I/O device. I/O functions may be identical or completely different from each other. All I/O functions are organized as a collection of registers, and there is a maximum of 131,072 registers possible for each I/O function.

19.5.9.1 SDIO Interrupts

In order to allow the SDIO card to interrupt the host, and interrupt function is added to a pin on the SD interface. Pin number 8 which is used as DAT[1] when operating in the 4 bit SD mode is used to signal the card's interrupt to the host. The use of interrupt is optional for each card or function within a card. The SDIO interrupt is "level sensitive", that is, the interrupt line must be held active (low) until it is either recognized and acted upon by the host or de-asserted due to the end of the Interrupt Period.

Once the host has serviced the interrupt, it is cleared via an IO write to the appropriate bit in the CCCR. The interrupt output of all SDIO cards is active low. This host controller provides pull-up resistors on all data lines DAT[3:0].

As Pin 8 of the card is shared between the IRQ and DAT[1] use in the 4 bit SD mode, and interrupt shall only be sent by the card and recognized by the host during a specific time. The time that a low on Pin 8 will be recognized as an interrupt is defined as the Interrupt Period.

The host here will only sample the level of Pin 8 (DAT[1]/IRQ) into the interrupt detector during the Interrupt Period. At all other times, the host will ignore the level on Pin 8. Note that the Interrupt Period is applicable for both memory and IO operations. The definition of the Interrupt Period is different for operations with single block and multiple block data transfer.

19.5.9.2 SDIO Suspend/Resume

Within a multi-function SDIO or a Combo (Mix IO and Memory) card, there are multiple devices (I/O and memory) that must share access to the SD bus. In order to allow the sharing of access to the host among multiple devices, SDIO and combo cards can implement the optional concept of suspend/resume. In a card supports suspend/resume, the host may temporarily halt a data transfer operation to one function or memory (suspend) in order to free the bus for a higher priority transfer to a different function or memory. Once this higher-priority transfer is complete, the original transfer is re-started where it left off (resume). The host controller here is supported by all IO functions except zero, and the memory of a combo card, and can suspend multiple transactions and resume them in any order desired. IO function zero does not support suspend/resume.

The procedure used to perform the Suspend/Resume operation on the SD bus is:

- 1 The host determines which function currently used the DAT[] line(s).
- 2 The host requests the lower priority or slower transaction to suspend.
- 3 The host checks for the transaction suspension to complete.
- 4 The host begins the higher priority transaction.
- 5 The host waits for the completion of the higher priority transaction.
- 6 The host restores the suspended transaction.

19.5.9.3 SDIO Read Wait

The optional Read Wait (RW) operation is defined only for the SD 1-bit and 4-bit modes. The read wait operation allows a host to signal a card that it is doing a read multiple (CMD53) operation to temporarily stall the data transfer while allowing the host to send commands to any function within the SDIO device. To determine if a card supports the Read Wait protocol, the host must test capability bits in CCCR. The timing for Read Wait is base on the Interrupt Period.

19.5.10 Clock Control

The software should guarantee that the card identification process starts in open-drain mode with the clock rate fod (0 ~ 400khz). In addition, the software should also make the card into interrupt mode with fod (only for MMC). The commands that require fod are CMD0, CMD1, CMD2, CMD3, CMD5, CMD40 and ACMD41. In data transfer mode, the MSC controller can operate card with clock rate fpp (0 ~ 25Mhz).

19.5.11 Application Specified Command Handling

The MultiMediaCard/SD system is designed to provide a standard interface for a variety applications types. In this environment it is anticipate that there will be a need for specific customers/applications features. To enable a common way of implementing these features, two types of generic commands are defined in the standard: Application Specific Command, ACMD, and General Command, GEN_CMD.

GEN_CMD, this command, when received by the card, will cause the card to interpret the following command as an application specific command, ACMD. The ACMD has the same structure as of regular MultiMediaCard standard commands and it may have the same CMD number. The card will recognize it as ACMD by the fact that it appears after APP_CMD.

The only effect of the APP_CMD is that if the command index of the, immediately, following command has an ACMD overloading, the none standard version will used. If, as an example, a card has a definition for ACMD13 but not for ACMD7 then, if received immediately after APP_CMD command, Command 13 will be interpreted as the non standard ACMD13 but, command 7 as the standard CMD7.

In order to use one of the manufacturer specific ACMD's the host will:

- 1 Send APP_CMD. The response will have the APP_CMD bit (new status bit) set signaling to the host that ACMD is now expected.
- 2 Send the required ACMD. The response will have the APP_CMD bit set, indicating that the accepted command was interpreted as ACMD. If a non-ACMD is sent then it will be respected by the card as normal MultiMediaCard command and the APP_CMD bit in the Card Status stays clear.

If a non valid command is sent (neither ACMD nor CMD) then it will be handled as a standard MultiMediaCard illegal command error.

The bus transaction of the GEN_CMD is the same as the single block read or write commands (CMD24 or CMD17). The difference is that the argument denotes the direction of the data transfer (rather than the address) and the data block is not a memory payload data but has a vendor specific format and meaning.

The card shall be selected ('tran_state') before sending CMD56. The data block size is the

BLOCK_LEN that was defined with CMD16. The response to CMD56 will be R1b (card status + busy indication).

19.6 MMC/SD Controller Operation

19.6.1 Data FIFOs

The controller FIFOs for the response tokens, received data, and transmitted data are MSC_RES, MSC_RXFIFO, and MSC_TXFIFO, respectively. These FIFOs are accessible by the software and are described in the following paragraphs.

19.6.1.1 Response FIFO (MSC_RES)

The response FIFO, MSC_RES, contains the response received from an MMC/SD card after a command is sent from the controller. MSC_RES is a read-only, 16-bit, and 8-entry deep FIFO.

The FIFO will hold all possible response lengths. Responses that are only one byte long are located on the LSB of the 16-bit entry in the FIFO. The first half-word read from the response FIFO is the most significant half-word of the received response. For example, if the response format is R1, then the response read from RES_FIFO is bit [47:32], bit[31:16], bit[15:0] and in the third half-word only the low 8-bit is effective response [15:8] and the high 8-bit is ignored. If the response format is R2, then the response read from MSC_RES is bit [135:8] and needs reading 8 times.

The FIFO does not contain the response CRC. The status of the CRC check is in the status register, MSC_STAT.

19.6.1.2 Receive/Transmit Data FIFO (MSC_RXFIFO/MSC_TXFIFO)

The receive data FIFO and transmit data FIFO share one 16-entry x 32-bit FIFO, because at one time data are only received or are only transmitted. If it is used to receive data, it is called MSC_RXFIFO and read-only. If it is used to transmit data, it is called MSC_TXFIFO and write-only.

Data FIFO and its controls are cleared to a starting state after a system reset or at the beginning of the operations which include data transfer (MSC_CMDAT[DATA_EN] == 1).

If at any time MSC_RXFIFO becomes full and the data transmission is not complete, the controller turns the MSC_CLK off to prevent any overflows. When the clock is off, data transmission from the card stops until the clock is turned back on. After MSC_RXFIFO is not full, the controller turns the clock on to continue data transmission. The full status of the FIFO is registered in the MSC_STAT [DATA_FIFO_FULL] bit.

If at any time MSC_TXFIFO becomes empty and the data transmission is not complete, the controller turns the MSC_CLK off to prevent any underrun. When the clock is off, data transmission to the card stops until the clock is turned back on. When MSC_TXFIFO is no longer empty, the controller automatically restarts the clock. The empty status of the FIFO is registered in the MSC_STAT [DATA_FIFO_EMPTY] bit.

The FIFO is readable on word (32-bit) boundaries. The max read/written number is 16 words. The controller can correctly process big-endian and little-endian data.

Because at the beginning of the operation which include data transfer (MSC_CMDAT [DATA_EN] == 1), Data FIFO and its controls are cleared, software should guarantee data in FIFO have been read/written before beginning a new command.

19.6.2 DMA and Program I/O

Software may communicate to the MMC controller via the DMA or program I/O.

To access MSC_RXFIFO/MSC_TXFIFO with the DMA, the software must program the DMA to read or write the FIFO with source port width 32-bit, destination port width 32-bit, transfer data size 32-byte, transfer mode single. For example, to write 64 bytes of data to the MSC_TXFIFO, the software must program the DMA as follows:

```

DMA_DCTRn = 2           // Write 2 32-bytes (64 bytes)
DMA_DCCRn[SWDH] = 0    // source port width is 32-bit
DMA_DCCRn[DWDH] = 0    // destination port width is 32-bit
DMA_DCCRn[DS] = 4      // transfer data size is 32-byte
DMA_DCCRn[TM] = 4      // transfer mode is single
DMA_DCCRn[RDIL] = 0    // request detection interval length is 0
  
```

The number of 32-bytes should be calculated from the number of transferred bytes as follows:

The number of words = (The number of bytes + 31) / 32

If the number of transferred bytes is not the multiple of 4, the controller can correctly process endian.

The DMA trigger level is 8 words, that is to say, the DMA read trigger is when data words in MSC_RXFIFO is ≥ 8 and the DMA write trigger is when data words in MSC_TXFIFO is < 8 . Software can also configure DMA registers based on requirements, but the above 32-byte transfer data size is most efficient.

With program I/O, the software waits for the MSC_IREG [RXFIFO_RD_REQ] or MSC_IREG [TXFIFO_WR_REQ] interrupts before reading or writing the respective FIFO.

NOTES:

- 1 The MSC_CMDAT [DMA_EN] bit must be set to a 1 to enable communication with the DMA and it must be set to a 0 to enable program I/O.
- 2 DMA can be enabled only after MSC_CMDAT is written, because MSC_CMDAT [DATA_EN] is used to reset TX/RXFIFO.

19.6.3 Start and Stop clock

The software stops the clock as follows:

- 1 Write MSC_STRPCL with 0x01 to stop the MMC/SD bus clock.
- 2 Wait until MSC_STAT[CLK_EN] becomes zero.

To start the clock the software writes MSC_STRPCL with 0x02.

19.6.4 Software Reset

Reset includes the MSC reset and the card reset.

The MSC reset is through MSC_STRPCL [RESET] bit.

The card reset is to make the card into idle state. CMD0 (GO_IDLE_STATE) sets the MMC and SD memory cards into idle state. CMD52 (IO_RW_DIRECT, with argument 0x88000C08) reset the SD I/O card. The MMC/SD card are initialized with a default relative card address (RCA = 0x0001 for MMC and RCA = 0x0000 for SD) and with a default driver stage register setting (lowest speed, highest driving current capability).

The following registers must be set before the clock is started:

- 1 Stop the clock.
- 2 Set MSC_STRPCL register to 0x08 to reset MSC.
- 3 Wait while MSC_STAT [IS_RESETTING] is 1.
- 4 Set MSC_CMD with CMD0.
- 5 Update the MSC_CMDAT register as follows:
 - a Write 0x0000 to MSC_CMDAT [RESPONSE_FORMAT].
 - b Clear the MSC_CMDAT [DATA_EN] bit.
 - c Clear the MSC_CMDAT [BUSY] bit.
 - d Clear the MSC_CMDAT [INIT] bit.
- 6 Start the clock.
- 7 Start the operation (write MSC_STRPCL with 0x04).
- 8 Wait for the END_CMD_RES interrupt.
- 9 Set MSC_CMD with CMD52.
- 10 Set MSC_ARG with 0x88000C08.
- 11 Update the MSC_CMDAT register as follows:
 - a Write 0x005 to MSC_CMDAT [RESPONSE_FORMAT].
 - b Clear the MSC_CMDAT [DATA_EN] bit.
 - c Clear the MSC_CMDAT [BUSY] bit.
 - d Clear the MSC_CMDAT [INIT] bit.
- 12 Start the operation.
- 13 Wait for the END_CMD_RES interrupt.

19.6.5 Voltage Validation and Card Registry

At most 10 MMC and 1 SD (either SDMEM or SDIO) can be inserted MMC/SD bus at the same time, and their voltage validation and card registry steps are different, so the software should be programmed as follows:

- 1 Check whether SDIO card is inserted.
- 2 Check whether SDMEM card is inserted.
- 3 Check whether MMC cards are inserted.

19.6.5.1 Check SDIO

The commands are sent as follows:

- 1 (Optional) Send CMD52 (IO_RW_DIRECT) with argument 0x88000C08 to reset SDIO card.
- 2 Send CMD5 (IO_SEND_OP_CMD) to validate voltage.
- 3 If the response is correct and the number of IO functions > 0, then continue, else go to check SDMEM.
- 4 If C-bit in the response is ready (the initialization has finished), go to 6.
- 5 Send CMD5 (IO_SEND_OP_CMD) to validate voltage, then go to 4.
- 6 If memory-present-bit in the response is true, then it is a combo card (SDIO + Memory), else it is only a SDIO card.
- 7 If it is a combo card, go to check SDMEM to initialize the memory part.
- 8 Send CMD3 (SET_RELATIVE_ADDR) to let the card publish a RCA. The RCA is returned from the response.
- 9 If do not accept the new RCA, go to 8, else record the new RCA.
- 10 Go to check MMC, because we can assure that there is no SDMEM card.

19.6.5.2 Check SDMEM

If there is no SDIO card or there is a combo card, continue to check SDMEM.

The commands are sent as follows:

- 1 (Optional) Send CMD0 (GO_IDLE_STATE) to reset MMC and SDMEM card. This command has no response.
- 2 Send CMD55. Here the default RCA 0x0000 is used for CMD55.
- 3 If the response is correct (CMD55 has response), then continue, else go to check MMC.
- 4 Send ACMD41 (SD_SEND_OP_CMD) to validate voltage (the general OCR value is 0x00FF8000).
- 5 If the initialization has finished, go to 7. (The response is the OCR register and it includes a status information bit (bit [31]). This status bit is set if the card power up procedure has been finished. As long as the card is busy, the corresponding bit[31] is set to LOW.)
- 6 Send CMD55 and ACMD41 to validate voltage, and then go to 5.
- 7 Send CMD2 (ALL_SEND_CID) to get the card CID.
- 8 Send CMD3 (SET_RELATIVE_ADDR) to let card publish a RCA. The RCA is returned from the response.

- 9 If do not accept the new RCA, go to 8, else record the new RCA.
- 10 Go to check MMC.

19.6.5.3 Check MMC

Because there may be several MMC card, so some steps (5 ~ 8) should be repeated several times.

The commands are sent as follows:

- 1 Send CMD1 (SEND_OP_CMD) to validate voltage (the general OCR value is 0x00FF88000).
- 2 If the response is correct, then continue, else goto 9.
- 3 If the initialization has finished, go to 5. (The response is the OCR register and it includes a status information bit (bit [31]). This status bit is set if the card power up procedure has been finished. As long as the card is busy, the corresponding bit[31] is set to LOW.)
- 4 Send CMD1 (SEND_OP_CMD) to validate voltage, and then go to 3.
- 5 Send CMD2 (ALL_SEND_CID) to get the card CID.
- 6 If the response timeout occurs, goto 9.
- 7 Send CMD3 (SET_RELATIVE_ADDR) to assign the card a RCA.
- 8 If there are other MMC cards, then go to 5.
- 9 Finish.

19.6.6 Single Data Block Write

In a single block write command, the following registers must be set before the operation is started:

- 1 Set MSC_NOB register to 0x0001.
- 2 Set MSC_BLKLEN to the number of bytes per block.
- 3 Update the MSC_CMDAT register as follows:
 - a Write 0x001 to MSC_CMDAT [RESPONSE_FORMAT].
 - b Write 0x2 to MSC_CMDAT [BUS_WIDTH] if the card is SD, else clear it.
 - c Set the MSC_CMDAT [DATA_EN] bit.
 - d Set the MSC_CMDAT [WRITE_READ] bit.
 - e Clear the MSC_CMDAT [STREAM_BLOCK] bit.
 - f Clear the MSC_CMDAT [BUSY] bit.
 - g Clear the MSC_CMDAT [INIT] bit.
- 4 Start the operation.
- 5 Write MSC_IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

- 1 Wait for the MSC_IREG [END_CMD_RES] interrupt.
- 2 Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt.
At the same time write data to the MSC_TXFIFO and continue until all of the data have been written to the FIFO.
- 3 Wait for MSC_IREG [PROG_DONE] interrupt. This interrupt indicates that the card has finished programming. Certainly software may start another command sequence on a

different card.

- 4 Read the MSC_STAT register to verify the status of the transaction (i.e. CRC error status).

To address a different card, the software sends a select command to that card by sending a basic no data command and response transaction. To address the same card, the software must wait for MSC_IREG [PROG_DONE] interrupt. This ensures that the card is not in the busy state.

In addition, CMD26 (PROGRAM_CID), CMD27 (PROGRAM_CSD), CMD42 (LOCK/UNLOCK), CMD56 (GEN_CMD: write) and CMD53 (single_block_write) operations are similar to single block write.

19.6.7 Single Block Read

In a single block read command, the following registers must be set before the operation is started:

- 1 Set MSC_NOB register to 0x0001.
- 2 Set MSC_BLKLEN register to the number of bytes per block.
- 3 Update the following bits in the MSC_CMDAT register:
 - a Write 0x001 to MSC_CMDAT [RESPONSE_FORMAT].
 - b Write 0x2 to MSC_CMDAT [BUS_WIDTH] if the card is SD, else clear it.
 - c Set the MSC_CMDAT [DATA_EN] bit.
 - d Clear the MSC_CMDAT [WRITE_READ] bit.
 - e Clear the MSC_CMDAT [STREAM_BLOCK] bit.
 - f Clear the MSC_CMDAT [BUSY] bit.
 - g Clear the MSC_CMDAT [INIT] bit.
- 4 Start the operation.
- 5 Write MSC_IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

- 1 Wait for the MSC_IREG [END_CMD_RES] interrupt.
- 2 Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt.

At the same time read data from the MSC_RXFIFO as data becomes available in the FIFO, and continue reading until all data is read from the FIFO.
- 3 Read the MSC_STAT register to verify the status of the transaction (i.e. CRC error status).

In addition, CMD30 (SEND_WRITE_PROT), ACMD13 (SD_STATUS), CMD56 (GEN_CMD-read), ACMD51 (SEND_SCR) and CMD53 (single_block_read) are similar to single block read.

19.6.8 Multiple Block Write

The multiple block write mode is similar to the single block write mode, except that multiple blocks of data are transferred. Each block is the same length. All the registers are set as they are for the single block write, except that the MSC_NOB register is set to the number of blocks to be written.

The multiple block write mode also requires a stop transmission command, CMD12, after the data is transferred to the card. After the MSC_IREG [DATA_TRAN_DONE] interrupt occurs, the software must program the controller register to send a stop data transmission command.

If multiple block write with pre-defined block count (refer to MMC spec v-3.3) is used, CMD12 should not be sent.

For SDIO card, CMD53 (multiple_block_write) is also similar, but when IO abort (CMD52) is sent, MSC_CMDAT [IO_ABORT] should be 1.

Table 19-8 How to stop multiple block write

Operation	Stop condition	Software processing
Open-ended or SDIO infinite	After write MSC_NOB blocks	<ol style="list-style-type: none"> 1 Wait for DATA_TRAN_DONE interrupt. 2 Send CMD12 or CMD52 (IO abort). 3 Wait for END_CMD_RES and PRG_DONE interrupt.
Open-ended or SDIO infinite	Stop writing in advance (not write MSC_NOB blocks)	<ol style="list-style-type: none"> 1 Set MSC_STRPCL [EXIT_MULTIPLE]. 2 Wait for DATA_TRAN_DONE interrupt. 3 Send CMD12 or CMD52 (IO abort). 4 Wait for END_CMD_RES and PRG_DONE interrupt.
Predefined block or SDIO finite	After writing MSC_NOB blocks	<ol style="list-style-type: none"> 1 Wait for DATA_TRAN_DONE interrupt.
Predefined block or SDIO finite	Stop writing in advance (not write MSC_NOB blocks)	<ol style="list-style-type: none"> 1 Set MSC_STRPCL [EXIT_MULTIPLE]. 2 Wait for DATA_TRAN_DONE interrupt. 3 Send CMD12 or CMD52 (IO abort). 4 Wait for END_CMD_RES and PRG_DONE interrupt.

19.6.9 Multiple Block Read

The multiple blocks read mode is similar to the single block read mode, except that multiple blocks of data are transferred. Each block is the same length. All the registers are set as they are for the single block read, except that the MSC_NOB register is set to the number of blocks to be read.

The multiple blocks read mode requires a stop transmission command, CMD12, after the data from the card is received. After the MSC_IREG [DATA_TRAN_DONE] interrupt has occurred, the software must

program the controller registers to send a stop data transmission command.

If multiple block read with pre-defined block count (refer to MMC spec v-3.3) is used, CMD12 should not be sent.

For SDIO card, CMD53 (multiple_block_read) is also similar, but when IO abort (CMD52) is sent, MSC_CMDAT [IO_ABORT] should be 1.

Table 19-9 How to stop multiple block read

Operation	Stop condition	Software processing
Open-ended or SDIO infinite	After reading MSC_NOB blocks	1 Wait for DATA_TRAN_DONE interrupt. 2 Send CMD12 or CMD52 (IO abort). 3 Wait for END_CMD_RES interrupt.
Open-ended or SDIO infinite	Stop reading in advance (not write MSC_NOB blocks)	1 Set MSC_STRPCL [EXIT_MULTIPLE]. 2 Wait for DATA_TRAN_DONE interrupt. 3 Send CMD12 or CMD52 (IO abort). 4 Wait for END_CMD_RES interrupt.
Predefined block or SDIO finite	After reading MSC_NOB blocks	1 Wait for DATA_TRAN_DONE interrupt.
Predefined block or SDIO finite	Stop reading in advance (not write MSC_NOB blocks)	1 Set MSC_STRPCL [EXIT_MULTIPLE]. 2 Wait for DATA_TRAN_DONE interrupt. 3 Send CMD12 or CMD52 (IO abort). 4 Wait for END_CMD_RES interrupt.

19.6.10 Stream Write (MMC)

In a stream write command, the following registers must be set before the operation is started:

- 1 Update MSC_CMDAT register as follows:
 - a Write 0x001 to the MSC_CMDAT [RESPONSE_FORMAT].
 - b Clear the MSC_CMDAT [BUS_WIDTH] because only MMC support stream write.
 - c Set the MSC_CMDAT [DATA_EN] bit.
 - d Set the MSC_CMDAT [WRITE_READ] bit.
 - e Set the MSC_CMDAT [STREAM_BLOCK] bit.
 - f Clear the MSC_CMDAT [BUSY] bit.
 - g Clear the MSC_CMDAT [INIT] bit.
- 2 Start the operation.
- 3 Write MSC_IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

- 1 Wait for the MSC_IREG [END_CMD_RES] interrupt.
- 2 Write data to the MSC_TXFIFO and continue until all of the data is written to the Data FIFO.
- 3 Stop clock. Wait until MSC_STAT[CLK_EN] becomes 0. The clock must be stopped.
- 4 Set the command registers for a stop transaction command (CMD12) and other registers.
- 5 Start the clock and start the operation.
- 6 Wait for the MSC_IREG [END_CMD_ERS] interrupt.
- 7 Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt.
- 8 Wait for the MSC_IREG [PRG_DONE] interrupt. This interrupt indicates that the card has finished programming. Certainly software may start another command sequence on a different card.
- 9 Read the MSC_STAT register to verify the status of the transaction.

To address a different card, the software must send a select command to that card by sending a basic no data command and response transaction. To address the same card, the software must wait for MSC_IREG [PRG_DONE] interrupt. This ensures that the card is not in the busy state.

If partial blocks are allowed (if CSD parameter WRITE_BL_PARTIAL is set) the data stream can start and stop at any address within the card address space, otherwise it shall start and stop only at block boundaries. If WRITE_BL_PARTIAL is not set, 16 more stuff bytes need to be written after the useful written data, otherwise only write the useful written data.

19.6.11 Stream Read (MMC)

In a stream read command, the following registers must be set before the operation is turned on:

- 1 Update the MSC_CMDAT register as follows:
 - a Write 0x01 to the MSC_CMDAT [RESPONSE_FORMAT].
 - b Clear the MSC_CMDAT [BUS_WIDTH] because only MMC support stream read.
 - c Clear the MSC_CMDAT [WRITE_READ] bit.
 - d Set the MSC_CMDAT [STREAM_BLOCK] bit.
 - e Clear the MSC_CMDAT [BUSY] bit.
 - f Clear the MSC_CMDAT [INIT] bit.
- 2 Start the operation.
- 3 Write MSC_IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

- 1 Wait for the MSC_IREG [END_CMD_RES] interrupt.
- 2 Read data from the MSC_RXFIFO and continue until all of the expected data has been read from the FIFO.
- 3 Write MSC_STRPCL [EXIT_TRANSER] with 1. If MSC_STAT[DATA_FIFO_FULL] is 1, then read MSC_RXFIFO to make it not full. Because if data FIFO is full, MSC_CLK is stopped. Here, the data FIFO contains useless data.
- 4 Set the command registers for a stop transaction command (CMD12) and send it. There is no

need to stop the clock.

- 5 Wait for the MSC_IREG [END_CMD_RES].
- 6 Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt.
- 7 Read the MSC_STAT register to verify the status of the transaction.

19.6.12 Erase, Select/Deselect and Stop

For CMD7 (SELECT/DESELECT_CARD), CMD12 (STOP_TRANSMISSION) and CMD38 (ERASE), the following registers must be set before the operation is started:

- 1 Update the MSC_CMDAT register as follows:
 - a Write 0x01 to the MSC_CMDAT [RESPONSE_FORMAT].
 - b Clear the MSC_CMDAT [DATA_EN] bit.
 - c Clear the MSC_CMDAT [WRITE_READ] bit.
 - d Clear the MSC_CMDAT [STREAM_BLOCK] bit.
 - e Set the MSC_CMDAT [BUSY] bit.
 - f Clear the MSC_CMDAT [INIT] bit.
- 2 Start the operation.
- 3 Write MSC_IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

- 1 Wait for the MSC_IREG [END_CMD_RES] interrupt.
- 2 Wait for the MSC_IREG [PRG_DONE] interrupt. If CMD12 is sent to terminate data read operation, then there is no need to wait for MSC_IREG [PRG_DONE] interrupt. This interrupt indicates that the card has finished programming. Certainly software may start another command sequence on a different card.

19.6.13 SDIO Suspend/Resume

The actual suspend/resume steps are as follows:

- 1 During data transfer, send CMD52 to require suspend. BR and RAW flag should be 1.
- 2 If BS flag in the response is 0, then suspend has been accepted and goto 4.
- 3 Send CMD52 to query card status. R flag should be 1. Go to 2.
- 4 Write MSC_STRPCL [EXIT_TRANSFER] with 1.
- 5 Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt.
- 6 Read MSC_NOB, MSC_SNOB and etc, save them into variables.
- 7 Set registers for high priority transfer and start it.
- 8 Wait until high priority transfer is finished.
- 9 Restore registers from variables, but MSC_NOB should be (MSC_NOB – MSC_SNOB).
- 10 Send CMD52 to require resume. FSx should be resumed function number.

19.6.14 SDIO ReadWait

The actual ReadWait steps are as follows:

- 1 During multiple block read, read MSC_SNOB. If MSC_SNOB is nearby or equal to MSC_NOB, no need to use ReadWait.
- 2 Write MSC_STRPCL [START_READWAIT] with 1.
- 3 Wait until MSC_STAT [IS_READWAIT] becomes 1.
- 4 Send CMD52 to query card status.
- 5 Write MSC_STRPCL [STOP_READWAIT] with 1.

19.6.15 Operation and Interrupt

The software can use polling-status method to operate the MMC/SD card, but this is not the proposed method, because its performance is very low. The proposed method is to use interrupt. Generally there are fixed necessary steps to finish each command. The steps are as follows:

- 1 (Optional) Stop clock. Poll CLK_EN.
- 2 Fill the registers (MSC_CMD, MSC_CMDAT, MSC_ARG, MSC_CLKRT, and etc).
- 3 (Optional) Start clock.
- 4 Start the operation. Wait for the MSC_IREG [END_CMD_RES] interrupt.
- 5 Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt.
- 6 Send STOP_TRANS (CMD12) or I/O abort (CMD52). Wait for the MSC_IREG [END_CMD_ERS] interrupt.
- 7 Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt.
- 8 Wait for the MSC_IREG [PRG_DONE] interrupt.

Table 19-10 The mapping between Commands and Steps

Index	Abbreviation	1	2	3	4	5	6	7	8	Comments
CMD0	GO_IDLE_STATE	Y	Y	Y	Y					
CMD1	SEND_OP_COND	Y	Y	Y	Y

CMD42	LOCK/UNLOCK	Y	Y	Y	Y	Y			Y	
CMD55	APP_CMD	Y	Y	Y	Y					
CMD56	GEN_CMD	Y	Y	Y	Y	Y				Read
CMD56	GEN_CMD	Y	Y	Y	Y	Y			Y	Write
ACMD6	SET_BUS_WIDTH	Y	Y	Y	Y					
ACMD13	SD_STATUS	Y	Y	Y	Y	Y				
ACMD22	SEND_NUM_WR_BLOCKS	Y	Y	Y	Y					
ACMD23	SET_WR_BLOCK_COUNT	Y	Y	Y	Y					
ACMD41	SD_SEND_OP_COND	Y	Y	Y	Y					
ACMD42	SET_CLR_CARD_DETECT	Y	Y	Y	Y					
ACMD51	SEND_SCR	Y	Y	Y	Y	Y				

NOTE: For stream read/write, STOP_CMD is sent after finishing data transfer. For write, STOP_CMD is with the last six bytes. For read, STOP_CMD is sent after receiving data and card sends some data which MSC ignores.

20 UART Interface

This chapter describes the universal asynchronous receiver/transmitter (UART) serial ports. There are two UARTs: All UARTs use the same programming model. Each of the serial ports can operate in interrupt based mode or DMA-based mode.

The Universal asynchronous receiver/transmitter (UART) is compatible with the 16550 industry standard and can be used as slow infrared asynchronous interface that conforms to the Infrared Data Association (IrDA) serial infrared specification 1.1.

20.1 Overview

- Full-duplex operation
- 5-, 6-, 7- or 8-bit characters with optional no parity or even or odd parity and with 1, 1½, or 2 stop bits
- 16x8bit transmit FIFO and 16x11bit receive FIFO
- Independently controlled transmit, receive (data ready or timeout), line status interrupts
- Baud rate generation allows up to 230.4Kbps
- Internal diagnostic capability Loopback control and break, parity, overrun and framing-error is provided
- Separate DMA requests for transmit and receive data services in FIFO mode
- Modem Control Functions are provided
- Slow infrared asynchronous interface that conforms to IrDA specification

20.2 Pin Description

Table 20-1 UART Pins Description

Name	Type	Description
RxD	Input	Receive data input
TxD	Output	Transmit data output
CTS_	Input	Clear to Send — Modem Transmission enabled
RTS_	Output	Request to Send — UART Transmission request

20.3 Register Description

All UART register 32-bit access address is physical address. When ULCR.DLAB is 0, URBR, UTHR and UIER can be accessed; When ULCR.DLAB is 1, UDLLR and UDLHR can be accessed.

Table 20-2 UART Registers Description

Name	Description	RW	Reset Value	Address	Access Size
URBR0	UART Receive Buffer Register 0	R	0x??	0x10030000	8
UTHR0	UART Transmit Hold Register 0	W	0x??	0x10030000	8
UDLLR0	UART Divisor Latch Low Register 0	RW	0x00	0x10030000	8

20.3.1 UART Receive Buffer Register (URBR)

The read-only URBR is corresponded to one level 11bit buffer in non-FIFO mode and a 16x11bit FIFO that holds the character(s) received by the UART. Bits in URBR are right-justified when being configured to use fewer than eight bits, and the rest of most significant data bits are zeroed and the most significant three bits of each buffer are the status for the character in the buffer. If ULSR.DRY is 0, don't read URBR, otherwise wrong operation may occur.

Bits	Name	Description	RW
7:0	URBR	8-bit UART receive read data.	R

20.3.2 UART Transmit Hold Register (UTHR)

The write-only UTHR is corresponded to one level 8 bit buffer in non-FIFO mode and a 16x8bit FIFO in FIFO mode that holds the data byte(s) to be transmitted next.

Bits	Name	Description	RW
7:0	UTHR	8-bit UART transmit write hold data.	W

20.3.3 UART Divisor Latch Low/High Register (UDLLR / UDLHR)

UART Divisor Latch registers, UDLLR/UDLHR together compose the divisor for the programmable baud rate generator that can take the 3.6864-MHz fixed-input clock and divide it by 1 to (2¹⁶ - 1). UDLHR/UDLLR stores the high/low 8-bit of the divisor respectively. Load these divisor latches during initialization to ensure that the baud rate generator operates properly. If both Divisor Latch registers are 0, the 16X clock stops. The maximum baud rate is 230.4kbps.

The relationship of baud rate and the value of Divisor is shown by the formula:

$$\text{Baud Rate} = 3.6864 \text{ Mhz} / (16 * \text{Divisor})$$

20.3.4 UART Interrupt Enable Register (UIER)

The UART Interrupt Enable Register (UIER) contains the interrupt enable bits for the five types of interrupts (receive data ready, timeout, line status, and transmit data request, and modem status) that set a value in UIIR.

Bits	Name	Description	RW
7:5	Reserved	Always read 0, write is ignored.	R
4	RTOIE	Receive Timeout Interrupt Enable. 0: Disable the receive timeout interrupt 1: Enable the receive timeout interrupt Timeout means the URDR (FIFO mode) is not empty but no character has received for a period of time T: T (bits) = 4 X Word length + 12.	RW
3	MSIE	Modem Status Interrupt Enable. 0: Disable the modem status interrupt 1: Enable the modem status interrupt	RW
2	RLSIE	Receive Line Status Interrupt Enable. 0: Disable receive line status interrupt 1: Enable receive line status interrupt	RW
1	TDRIE	Transmit Data Request Interrupt Enable. 0: Disable the transmit data request interrupt 1: Enable the transmit data request interrupt	RW
0	RDRIE	Receive Data Ready Interrupt Enable. 0: Disable the receive data ready interrupt 1: Enable the receive data ready interrupt	RW

20.3.5 UART Interrupt Identification Register (UIIR)

The read-only UART Interrupt Identification Register (UIIR) records the prioritized pending interrupt source information. Its initial value after power-on reset is 0x01.

Bits	Name	Description	RW																		
7:6	FFMSEL	FIFO Mode Select. 0b00: Non-FIFO mode 0b01: Reserved 0b10: Reserved 0b11: FIFO mode	R																		
5:4	Reserved	Always read 0, write is ignored.	R																		
3:1	INID	Interrupt Identifier. These bits identify the current highest priority pending interrupt. <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 5px;"> <thead> <tr> <th style="width: 15%;">INID</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0b000</td> <td>Modem Status</td> </tr> <tr> <td>0b001</td> <td>Transmit Data Request</td> </tr> <tr> <td>0b010</td> <td>Receive Data Ready</td> </tr> <tr> <td>0b011</td> <td>Receive Line Status</td> </tr> <tr> <td>0b100</td> <td>Reserved</td> </tr> <tr> <td>0b101</td> <td>Reserved</td> </tr> <tr> <td>0b110</td> <td>Receive Time Out</td> </tr> <tr> <td>0b111</td> <td>Reserved</td> </tr> </tbody> </table> See Table 20-3 for details.	INID	Description	0b000	Modem Status	0b001	Transmit Data Request	0b010	Receive Data Ready	0b011	Receive Line Status	0b100	Reserved	0b101	Reserved	0b110	Receive Time Out	0b111	Reserved	R
INID	Description																				
0b000	Modem Status																				
0b001	Transmit Data Request																				
0b010	Receive Data Ready																				
0b011	Receive Line Status																				
0b100	Reserved																				
0b101	Reserved																				
0b110	Receive Time Out																				
0b111	Reserved																				
0	INPEND	Interrupt Pending. 0: interrupt is pending 1: No interrupt pending	R																		

Table 20-3 UART Interrupt Identification Register Description

UIIR.INID	Interrupt Set/Clear Cause			
	Priority	Type	Source	Clear Condition
0b0001	—	None	No pending interrupt	—

0b0110	1st Highest	Receive Line Status	Overrun, Parity, Frame Error, Break Interrupt, and FIFO Error (DMA mode only)	Reading ULSR or empty all the error characters in DMA mode
0b0100	2nd Highest	Receive Data Ready	FIFO mode: Trigger threshold was reached Non-FIFO mode: URBR full	FIFO mode: Reading URBR till below trigger threshold. Non-FIFO mode: Empty URBR
0b1100	2nd Highest	Receive Timeout	FIFO mode only: URBR not empty but no data read in for a period of time	Reset receive buffer by setting UFCR.RFRT to 1 or Reading URBR
0b0010	3rd Highest	Transmit Data Request	FIFO mode: Empty location in UTHR equal to half or more than half Non-FIFO mode: UTHR empty	FIFO mode: Data number in UTHR more than half Non-FIFO mode: Writing UTHR
0b0000	4th Highest	Modem Status	Modem CTS_ pin status change	Reading UMSR

20.3.6 UART FIFO Control Register (UFCR)

The write-only register UFCR contains the control bits for receive and transmit FIFO.

Bits	Name	Description	RW
7:6	RDTR	Receive Buffer Data Number Trigger. These bits are used to select the trigger level for the receive data ready interrupt in FIFO mode. 0b00: 1 0b01: 4 0b10: 8 0b11: 15	W
5	Reserved	Always read 0, write is ignored.	R
4	UME	UART Module Enable. 0: Disable UART 1: Enable UART	W

3	DME	DMA Mode Enable. 0: Disable DMA mode 1: Enable DMA mode	W
2	TFRT	Transmit Holding Register Reset. 0: Not reset 1: Reset transmit FIFO	W
1	RFRT	Receive Buffer Reset. 0: Not reset 1: Reset receive FIFO	W
0	FME	FIFO Mode Enable. Set this bit before the trigger levels. 0: non-FIFO mode 1: FIFO mode	W

20.3.7 UART Line Control Register (ULCR)

The ULCR defines the format for UART data transmission.

		0x1003000C, 0x1003100C 0x1003200C, 0x1003300C							
Bit		7 6 5 4 3 2 1 0							
		<table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td style="writing-mode: vertical-rl; transform: rotate(180deg);">DLAB</td> <td style="writing-mode: vertical-rl; transform: rotate(180deg);">SBK</td> <td style="writing-mode: vertical-rl; transform: rotate(180deg);">STPAR</td> <td style="writing-mode: vertical-rl; transform: rotate(180deg);">PARM</td> <td style="writing-mode: vertical-rl; transform: rotate(180deg);">PARE</td> <td style="writing-mode: vertical-rl; transform: rotate(180deg);">SBSL</td> <td style="writing-mode: vertical-rl; transform: rotate(180deg);">WLS</td> </tr> </table>	DLAB	SBK	STPAR	PARM	PARE	SBSL	WLS
DLAB	SBK	STPAR	PARM	PARE	SBSL	WLS			
RST		0 0 0 0 0 0 0 0							

Bits	Name	Description	RW
7	DLAB	Divisor Latch Access Bit. 0: Enable to access URBR, UTHR or UIER 1: Enable to access UDLLR or UDLHR	W
6	SBK	Set Break. Causes a break condition (at least one 0x00 data) to be transmitted to the receiving UART. Acts only on the TXD pin and has no effect on the transmit logic. 0: No effect on TXD output 1: Forces TXD output to 0	W
5	STPAR	Sticky Parity. Setting this bit forces parity location to be opposite of PARM bit when PARE is 1 (it is ignored when PARE is 0). 0: Disable Sticky parity 1: Enable Sticky parity (opposite of PARM bit)	W
4	PARM	Parity Odd/Even Mode Select.	W

		If PARE = 0, PARM is ignored. 0: Odd parity 1: Even parity	
3	PARE	Parity Enable. Enables a parity bit to be generated on transmission or checked on reception. 0: No parity 1: Parity	W
2	SBLS	Stop Bit Length Select. Specifies the number of stop bits transmitted and received in each character. When receiving, the receiver checks only the first stop bit. 0: 1 stop bit 1: 2 stop bits, except for 5-bit character then 1-1/2 bits	W
1:0	WLS	Word Length Select. 0b00: 5-bit character 0b01: 6-bit character 0b10: 7-bit character 0b11: 8-bit character	W

20.3.8 UART Line Status Register (ULSR)

The read-only ULSR indicates status information during the data transfer. Receive error information in ULSR[4:1] remains set until software reads ULSR and it must be read before the error character is read.

Bits	Name	Description	RW
7	FIFOE	FIFO Error Status (FIFO mode only). FIFOE is set when there is at least one kind of receive error (parity, frame, overrun, break) for any of the characters in receive buffer. FIFOE is reset when all error characters are read out of the buffer. During DMA transfer, the error interrupt generates when FIFOE is 1, and no receive DMA request generates even when data in receive buffer reaches the trigger threshold until all the error characters are read out. In non-DMA mode, FIFOE set does not generate error interrupt.	R

		0: No error data in receive buffer or non-FIFO mode 1: One or more error character in receive buffer	
6	TEMP	Transmit Holding Register Empty. Set when both UTHR and shift register are empty. It is cleared when either the UTHR or the shift register contains a data character. 0: There is data in the transmit shifter and UTHR 1: All the data in the transmit shifter and UTHR has been shifted out	R
5	TDRQ	Transmit Data Request. Set when UTHR has half or more empty location (FIFO mode) or empty (non-FIFO mode). When both UIER.TDRIE and TDRQ are 1, transmit data request interrupt generates or during DMA transfer, DMA request to the DMA controller generates when UIER.TDRIE is 0 and TDRQ is 1. 0: There is one (non-FIFO mode) or more than half data (FIFO mode) in UTHR 1: None data (non-FIFO mode) or half or less than half data (FIFO mode) in UTHR	R
4	BI	Break Interrupt. BI is set when the received data input is held low for longer than a full-word transmission time (the total time of start bit + data bits + parity bit + stop bits). BI is cleared when the processor reads the ULSR. In FIFO mode, only one character equal to 0x00 is loaded into the FIFO regardless of the length of the break condition. BI shows the break condition for the character at the front of the FIFO, not the most recently received character. 0: No break signal has been received 1: Break signal received	R
3	FMER	Framing Error. Set when the bit following the last data bit or parity bit is detected to be 0. If the ULCR had been set for two or one and half stop bits, the other stop bits are not checked except the first one. In FIFO mode, FMER shows a framing error for the character at the front of the receive buffer, not for the most recently received character. Cleared when the processor reads the ULSR. 0: No framing error 1: Invalid stop bit has been detected	R
2	PARER	Parity Error. Indicates that the received data character does not have the correct even or odd parity, as selected by the even parity select bit. PARER is set upon detection if a parity error and is cleared when the processor reads the ULSR. In FIFO mode, PARER shows a parity error for the character	R

		at the front of the FIFO, not the most recently received character. 0: No parity error 1: Parity error has occurred	
1	OVER	Overrun Error. Set when both receive buffer and shifter are full and new data is received which will be lost. Cleared when the processor reads the ULSR. 0: No data has been lost 1: Receive data has been lost	R
0	DRY	Data Ready. Set when a complete incoming character has been received into the Receive Buffer registers. DRY is cleared when the receive buffer is read (non-FIFO mode) or when the buffer is empty or when the buffer is reset by setting UFCR.RFRT to 1. 0: No data has been received 1: Data is available in URBR	R

20.3.9 UART Modem Control Register (UMCR)

The UMCR uses the modem control pins RTS_ and CTS_ to control the interface with a modem or data set. UMCR also controls the loopback mode. Loopback mode must be enabled before the UART is enabled.

Bits	Name	Description	RW
7	MDCE	Modem Control Enable. 0: Modem function is disabled 1: Modem function is enabled	W
6:5	Reserved	Always read 0, write is ignored.	R
4	LOOP	Loop Back. This bit is used for diagnostic testing of the UART. When LOOP is 1, TXD output pin is set to a logic 1 state, RXD is disconnected from the pin, and the output of the transmitter shifter register is looped back into the receiver shift register input internally, similar to CTS_ and RTS_ pins and the RTS bit of the UMCR is connected to CTS bit of UMSR respectively. Loopback mode must be selected before the UART is enabled.	W

		0: Normal operation mode 1: Loopback-mode UART operation	
3	Reserved	Always read 0, write is ignored.	R
2	Reserved	Always read 0, write is ignored.	R
1	RTS	Request To Send. This bit can control the RTS_ output state. 0: RTS_ force to high 1: RTS_ force to low	W
0	Reserved	Always read 0, write is ignored.	R

20.3.10 UART Modem Status Register (UMSR)

The read-only UMSR provides the current state of the control lines from the modem to the processor. They are cleared when the processor reads UMSR.

Bits	Name	Description	RW
7	Reserved	Always read 0, write is ignored.	R
6	Reserved	Always read 0, write is ignored.	R
5	Reserved	Always read 0, write is ignored.	R
4	CTS	Status of Clear To Send. When MDCE bit is 1, this bit is the complement of CTS_ input. If Loop bit of UMCR is 1, this bit is equivalent to RTS bit of UMCR. 0: CTS_ pin is 1 1: CTS_ pin is 0	R
3	Reserved	Always read 0, write is ignored.	R
2	Reserved	Always read 0, write is ignored.	R
1	Reserved	Always read 0, write is ignored.	R
0	CCTS	Change status of CTS_. When MDCE bit is 1, this bit indicates the state change on CTS_ pin. 0: No state change on CTS_ pin since last read of UMSR 1: A change occurs on the state of CTS_ pin	R

20.3.11 UART Scratchpad Register

This Scratchpad register is used as a scratch register for the programmer and has no effect on the UART.

20.3.12 Infrared Selection Register (ISR)

The ISR is used to configure the slow-infrared (SIR) interface that is provided in each UART to support two-way wireless communication using infrared transmission that conforms to the IrDA serial infrared specification 1.1. The maximum frequency is up to 115.2kbps.

Bits	Name	Description	RW
7:5	Reserved	Always read 0, write is ignored.	R
4	RDPL	Receive Data Polarity. 0: Slow-infrared (SIR) interface decoder takes positive pulses as zeros 1: SIR decoder takes negative pulses as zeros	W
3	TDPL	Transmit Data Polarity. 0: SIR encoder generates a positive pulse for a data bit of zero 1: SIR encoder generates a negative pulse for a data bit of zero	W
2	XMODE	Transmit Pulse Width Mode. Set when the transmit encoder needs to generate 1.6us pulses (that are 3/16 of a bit-time at 115.2 kbps). Cleared when the transmit encoder needs to generate 3/16 of a bit-time wide according to current baud rate. 0: Transmit pulse width is 3/16 of a bit-time wide 1: Transmit pulse width is 1.6 us	W
1	RCVEIR	Receiver SIR Enable. This bit is used to select the signal from the RXD pin is processed by the IrDA decoder before it is fed to the UART (RCVEIR = 1) or bypass IrDA	W

		decoder and is fed directly to the UART (RCVEIR = 0). 0: Receiver is in UART mode 1: Receiver is in SIR mode	
0	XMITIR	Transmitter SIR Enable. This bit is used to select TXD output pin is processed by the IrDA encoder before it is fed to the device pin (XMITIR = 1) or bypass IrDA encoder and is fed directly to the device pin (XMITIR = 0). NOTE: disable infrared LED before XMITIR is set, otherwise a false start bit may occur. 0: Transmitter is in UART mode 1: Transmitter is in SIR mode	W

20.3.13 Uart M Register (UMR)

M is the value of UMR register.

It will take UART at least M cycles for transmitter to transmit one bit and receiver to receive one bit.

It will take UART at most M+1 cycles for transmitter to transmit one bit and receiver to receive one bit.

20.3.14 Uart Add Cycle Register(UACR)

If Nth bit of the register is 1 ,It will take Uart M+1 cycles to transmit or receive the bit of date for transmit or receive.

If the register is 12'h0 ,UART will receive or transmit a bit by M cycle .

If the register is 12'hfff ,UART will receive or transmit a bit by M+1 cycle .

For the detail to see [For any frequency clock to use the Uart.](#)

20.4 Operation

The following sections describe the UART operations that include flow of configuration, data transmission, data reception, and Infra-red mode.

20.4.1 UART Configuration

Before UART starts to transfer data or changing transfer format, configuration must be done to define the transfer format. The sample flow is as the following:

In FIFO mode, set FME bit of UFCR to 1, reset receive and transmit FIFO, then initialize the UART as described below.

- 1 Clear UFCR.UME to 0.
- 2 Set value in UDLL/UDHR to generate the baud rate clock.
- 3 Set data format in ULCR.
- 4 If it is in FIFO MODE, set FME bit and other FIFO control in UFCR, reset receive and transmit FIFO, otherwise skip item 4.
- 5 Set each interrupt enable bit in UIER in interrupt-based transfer or set UFCR.DME in DMA-based transfer (DMA transfer is FIFO mode only), then set UFCR.UME.

20.4.2 Data Transmission

After configuration, UART is ready for data transfer. For data transmission, refer to the following procedure:

- 1 Read ULSR.TDRQ (interrupt disable) or wait for transmit data request interrupt (interrupt enable), if TDRQ = 1 or transmit data request interrupt generates, that means there is enough empty location in UTHR for new data.
- 2 If ULSR.TDRQ is 1 or get the transmit data request interrupt, write transmit data to UTHR to start transmission.
- 3 Do item 1 and item 2 if there are more data waiting for transmit.
- 4 After all necessary data are written to UTHR, wait ULSR.TEMP = 1, that means all data completely transmitted.
- 5 If it is necessary to send break, set ULCR.SBK and at least wait for 1-bit interval time to send a valid break, then clear ULCR.SBK.
- 6 Clear UME bit to finish UART transmission.

20.4.3 Data Reception

After configuration, UART is ready for data transfer. For data reception, refer to the following sample procedure:

- 1 Read ULSR.DRY (interrupt disable) or wait for receive data request interrupt (interrupt enable), if ULSR.DRY = 1 or receive data request interrupt generates, that means URBR has one data (non-FIFO mode) or data in URBR reaches the trigger value (FIFO mode).
- 2 If ULSR.DRY = 1 or receive data request interrupt generates, then read ULSR.FIFOE or see if

- there is error interrupt, if FIFOE = 1, it means received data has receive error, then go to error handler, other wise go to item 3.
- 3 Read one received data in URBR (non-FIFO mode) or data equal to trigger value in URBR (FIFO mode).
 - 4 Check whether all data received: check whether ULSR.DRY = 0, in FIFO mode and interrupt is enabled, timeout interrupt may generate, when timeout interrupt generates, read URBR till ULSR.DRY = 0.
 - 5 Clear UFCR.UME to end data reception when all data are received and ULSR.DRY = 0.

20.4.4 Receive Error Handling

A sample error handling flow is as the following:

- 1 If ULSR.FIFOE = 1, it means there is receive error in received data, then check what error it is.
- 2 If ULSR.OVER = 1, go to OVER error handling.
- 3 If ULSR.BI = 1, go to Break handling.
- 4 If ULSR.FMER = 1, go to Frame error handling.
- 5 If PARER = 1, go to PARER error handling.

20.4.5 Modem Transfer

When UMCR.MDCE = 1, modem control is enabled. Transfer flow can be stopped and restarted by software through RTS_ and CTS_ pin. When UART transmitter detects low level on CTS_ pin, it stops transmission and TxD pin goes to mark state after finishing transmitting the current character until it detects CTS_ pin goes back to high level. RTS_ pin is output to receiving UART and its state can be controlled by setting UMCR.RTS bit, that is, setting UMCR.RTS to 1, RTS_ pin is low level output that means UART is ready to receive data, on the contrary, it means UART currently can't receive more data.

20.4.6 DMA Transfer

UART can operate in DMA-based (UFCR.DME = 1, FIFO mode only), that is, dma request initiated by UART takes the place of interrupt request and transmission/reception is carried out using DMA instead of CPU. Be sure that software guarantee to disable transmit and receive interrupt except timeout and error interrupts.

During DMA transfer, if an interrupt occurs, software must first read the ULSR to see if an error interrupt exists, then check the UIIR for the source of the interrupt and if DMA channel is already halt because of the error indicator from UART, then disable DMA channel and read out all the error data from receive FIFO. Software re-set and re-enable DMA and data transfer by DMA will re-start.

20.4.7 Slow IrDA Asynchronous Interface

Each UART supports slow infra-red (SIR) transmission and reception by setting ISR.XMITIR and ISR.RCVEIR to 1 (make sure the two bits are not set to 1 at the same time because SIR can't operate full-duplex). According to the IrDA 1.1, data rate is limited at a maximum value of 115.2Kbps.

In SIR transmit mode, the transmit pulse comes out at a rate of 3/16 (when the transmit data bit is zero); in SIR receive mode, the receiver must detect the 3/16 pulsed period to recognize a zero value (an active high or low pulse is demodulation to 0, and no pulse is demodulation to 1).

Compared to normal UART, there are some limitations to SIR, that is, each character is fixed to 8-bit data width, no parity and 1 stop bit and modem function is ignored. The IrDA 1.1 specifies a minimum 10ms latency after an optical node ceases transmitting before its receiver recovers its receiving function and software must guarantee this delay.

In the IrDA 1.1 specification, communication must start up at the rate of 9600bps, but then allows the link to negotiate higher (or lower) data rates if supported by both ends. However, the communication rate will not automatically change. Change, if necessary, is performed by software.

20.4.8 For any frequency clock to use the Uart

NOTE: if you don't set M register and UACR the uart work at normal mode with the specified frequencies. To use other frequency you should to set Mregister and UACR to right value.

1 The Improving

Following changes are made:

- a One bit is composed by M CLK_{BR} cycles, which can be 4~1024.
- b Some extra CLK_{BR} cycles can be inserted in some bits in one frame, so that like M has fraction.

For instance:

$$\text{CLK}_{\text{BR}} = \text{CLK}_{\text{DEV}} / N \quad N = 1, 2, \dots$$

$$\text{CLK}_{\text{BR}} = \text{CLK}_{\text{DEV}} = 4\text{MHz}$$

$$\text{Band rate} = 460800$$

In accurate

$$M_a = 8.681$$

We take

$$M = 8, \text{ with 8 extra cycles in every frame}$$

A 12-bit register is used to indicate where to insert the extra cycles.

For transmission, in theory, the biggest error is half of CLK_{BR} cycle, which is 0.125us here.

2 To set UMR register

$$CLK_{BR} = CLK_{DEV} / N$$

$$M_a = CLK_{BR} / \text{band rate}$$

M is moderm of M_a .

Write M to Mregister.

Considering the power and the robust quality, for M form 6 to 32 is you better select by set the UDLR.

The max error

$$\frac{0.5 / CLK_{BR}}{M_a / CLK_{BR}} = 0.5 / M_a < 0.5 / M$$

M	4	8	16	32	64
error/ W_{bit}	12.5%	6.25%	3.125%	1.56%	0.78%

3 To set UACR value

For each bit of it means:

0: means not to add additional cycle to the bit that uart is prepare to transmit or receive , in another word ,you will to use M cycles to transmit or receive the bit

1: means to add additional cycle to the bit that uart is prepare to transmit or receive, in another word, you will to use M+1 cycles to transmit or receive the bit
To set UACR value you must ensure that the max error of each bit should be less than $0.5P_{BR}$.

For example: $M_a - M = 0.15$; $M+1 - M_a = 0.85$;

Write UMR 8

Write UMR 408

cycle/bit	:	M, M, M, M+1, M, M, M, M, M, M, M+1, M
UACR	:	0 0 0 1 0 0 0 0 0 0 1 0

21 XBurst Boot ROM Specification

JZ4725 contains an internal 8KB boot ROM. The CPU boots from the boot ROM after reset.

21.1 Boot Select

The boot sequence of JZ4725 is controlled by boot_sel[1:0]. The configuration of boot_sel[1:0] is showed as below:

Table 21-1 Boot Configuration of JZ4725

boot_sel[1:0]	
00	Not used
01	Boot from USB device
10	Boot from 512 page size NAND flash at CS1
11	Boot from 2048 page size NAND flash at CS1

21.2 Boot Sequence

After reset, the boot program on the internal boot ROM executes as bellows:

- 1 Read boot_sel[1:0] and branch to proper programs according to it.
- 2 If it is boot from USB ("01"), connect USB cable to PC host, receive a block of data from USB and store it in internal SRAM. Then branch to this area in SRAM.
- 3 If it is boot from NAND flash ("10", or "11"), set proper NAND flash page size, read first byte from the NAND to know if it is 8 or 16 bits width, page cycle is 2 or 3 cycles. Set EMC according to it and read up to 8KB from NAND to internal SRAM. Then branch to SRAM at 4 bytes offset.

NOTE: The JZ4725 internal SRAM is 16KB, its address is from 0x80000000 to 0x80004000.

21.3 NAND Boot Specification

If CPU boots from NAND flash (CS1), the boot program will read the first byte from NAND flash to know if it is 8 or 16 bits width, page cycle is 2 or 3 cycles. If bit[7:4] of the first byte is zero, it is a 16-bit flash, else it is a 8-bit flash. If bit[3:0] of the first byte is zero, it is 2 page cycles, else it is 3 page cycles. The boot ROM will configure EMC and GPIO pins according to the first byte data, then continue to load up to 8KB from NAND to internal SRAM and branch to internal SRAM at 4 bytes offset.

The boot program can load two areas of data from NAND flash to internal SRAM, one is the normal area up to 8KB starting from NAND flash address 0, the other is the backup area up to 8KB starting from NAND flash address 0x2000. After reset, the boot program will first read the normal area data from NAND flash using hardware Reed-Solomon ECC. If no ECC error is detected or ECC error is correctable, the boot program then branches to internal SRAM at 4 bytes offset. If it detects an uncorrectable ECC error, it will continue to read the backup area of data from NAND flash using hardware Reed-Solomon ECC. If no ECC error is detected or ECC error is correctable, the boot program will then branch to internal SRAM at 4 bytes offset. If it detects an uncorrectable ECC error again, it will continue to start booting from NOR flash at CS4.

Every time the boot program starts reading a page, it first checks if the page contains valid data. If the page contains valid data, it will read the page to internal SRAM. If the page data is not valid, the boot program knows that it has finished reading all the data and then branches to internal SRAM at 4 bytes offset. The boot program will decide the page valid flag according to the 3rd, 4th, 5th byte of the spare area of each page. If one of the three bytes is zero, the boot program knows that this page data is valid, else this page data is not valid.

The boot program enables hardware RS ECC when reading NAND flash data. When a 512-byte data is read, it will check the calculated ECC with stored ECC. The calculated and stored ECC are both 9 bytes per 512-byte data. And the 9-byte stored ECC is starting from the 7th byte of the spare area of each page.

The NAND boot specification is showed as below:

Table 21-2 NAND First Data Byte Definition

First Byte of NAND	Data Bus Width of Flash
0xff	3 page cycles, 8-bit
0xf0	2 page cycles, 8-bit
0x0f	3 page cycles, 16-bit
0x00	2 page cycles, 16-bit

Table 21-3 NAND Spare Area Definition

Spare Area Offset	Description
0 – 1	Reserved

2 - 4	Page is valid if one of the three bytes is zero
5	Reserved
6 - 14	Stored 9-byte ECC of data0 - data511
15 - 23	Stored 9-byte ECC of data512 - data1023 (2KB page NAND only)
24 - 32	Stored 9-byte ECC of data1024 - data1535 (2KB page NAND only)
33 - 41	Stored 9-byte ECC of data1536 - data2047 (2KB page NAND only)

The procedure of the JZ4725 NAND boot is showed as below:

Figure 21-1 JZ4725 NAND Boot Sequence

21.4 USB Boot Specification

When boot_sel[1:0] is selected from USB boot, the internal boot ROM downloads user program from the USB port to internal SRAM and branches to the internal SRAM to execute the program.

The boot program supports both high-speed (480MHz) and full-speed (12MHz) transfer modes. The boot program uses the following two transfer types.

Table 21-4 Transfer Types Used by the Boot Program

Transfer Type	Description
Control Transfer	Used for transmitting standard requests and vendor requests.
Bulk Transfer	Used for responding to vendor requests and transmitting a user program.

The following figure shows an overview of the USB communication flow.

Figure 21-2 USB Communication Flow

The vendor ID and product ID for the USB boot device are 0x601A and 0x4740 respectively. The Configuration for USB is for Control Endpoint 0 with Max Packet Size equals 64 bytes, Bulk IN at Endpoint 1 with Max Packet Size equals 512 bytes in high-speed and 64 bytes in full-speed, Bulk OUT at Endpoint 1 with Max Packet Size equals 512 bytes in high-speed and 64 bytes in full-speed.

The USB boot program provides six vendor requests through control endpoint for user to download/upload data to/from device, and to branch to a target address to execute user program. The six vendor requests are VR_GET_CPU_INFO (0x00), VR_SET_DATA_ADDRESS (0x01), VR_SET_DATA_LENGTH (0x02), VR_FLUSH_CACHES (0x03), VR_PROGRAM_START1 (0x04) and VR_PROGRAM_START2 (0x05). User program is transferred through Bulk IN or Bulk OUT endpoint.

When JZ4725 is reset with boot_sel[1:0] equals 01b, the internal boot ROM will switch to USB boot mode and wait for USB requests from host. After connecting the USB device port to host, host will recognize the connection of a USB device, and start device enumeration. After finishing the device enumeration, user can send VR_GET_CPU_INFO (0x00) to query the device CPU information. If user wants to download/upload a program to/from device, two vendor requests VR_SET_DATA_ADDRESS (0x01) and VR_SET_DATA_LENGTH (0x02) should be sent first to tell the device the address and length in byte of the subsequent transferring data. Then data can be transferred through bulk-out/bulk-in endpoint. After this first stage program has been transferred to device, user can send vendor request VR_PROGRAM_START1 (0x04) to let the CPU to execute the program. This first stage program must not greater than 16KB and is normally used to init GPIO and SDRAM of the target board. At the end of the first stage program, it can return back to the internal boot ROM by jumping to ra (\$31) register. Thus user can download a new program to the SDRAM of the target board like the first stage, and send vendor request VR_FLUSH_CACHES (0x03) and VR_PROGRAM_START2 (0x05) to let the CPU to execute the new program. Next figure is the typical procedure of USB boot.

Figure 21-3 Typical Procedure of USB Boot

Following tables list all the vendor requests that USB boot program supports:

Table 21-5 Vendor Request 0 Setup Command Data Structure

Offset	Field	Size	Value	Description
0	bmRequestType	1	40H	D7 0: Host to Device D6-D5 2: Vendor D4-D0 0: Device
1	bRequest	1	00H	VR_GET_CPU_INFO: get CPU information
2	wValue	2	0000H	Not in used
4	wIndex	2	0000H	Not in used
6	wLength	2	0008H	8 bytes

Table 21-6 Vendor Request 1 Setup Command Data Structure

Offset	Field	Size	Value	Description
0	bmRequestType	1	40H	D7 0: Host to Device D6-D5 2: Vendor D4-D0 0: Device
1	bRequest	1	01H	VR_SET_DATA_ADDRESS: set address for next bulk-in/bulk-out transfer
2	wValue	2	xxxxH	MSB (bit[31:16]) of the data address
4	wIndex	2	xxxxH	LSB (bit[15:0]) of the data address
6	wLength	2	0000H	Not in used

Table 21-7 Vendor Request 2 Setup Command Data Structure

Offset	Field	Size	Value	Description
0	bmRequestType	1	40H	D7 0: Host to Device D6-D5 2: Vendor D4-D0 0: Device
1	bRequest	1	02H	VR_SET_DATA_LENGTH: set length in byte for next bulk-in/bulk-out transfer
2	wValue	2	xxxxH	MSB (bit[31:16]) of the data length
4	wIndex	2	xxxxH	LSB (bit[15:0]) of the data length
6	wLength	2	0000H	Not in used

Table 21-8 Vendor Request 3 Setup Command Data Structure

Offset	Field	Size	Value	Description
0	bmRequestType	1	40H	D7 0: Host to Device D6-D5 2: Vendor D4-D0 0: Device

1	bRequest	1	03H	VR_FLUSH_CACHES: flush I-Cache and D-Cache
2	wValue	2	0000H	Not in used
4	wIndex	2	0000H	Not in used
6	wLength	2	0000H	Not in used

Table 21-9 Vendor Request 4 Setup Command Data Structure

Offset	Field	Size	Value	Description
0	bmRequestType	1	40H	D7 0: Host to Device D6-D5 2: Vendor D4-D0 0: Device
1	bRequest	1	04H	VR_PROGRAM_START1: transfer data from D-Cache to I-Cache and branch to address in I-Cache. NOTE: After downloading program from host to device for the first time, you can only use this request to start the program. Since the USB boot program will download data to D-Cache after reset. This request will transfer data from D-Cache to I-Cache and execute the program in I-Cache.
2	wValue	2	xxxxH	MSB (bit[31:16]) of the program entry point
4	wIndex	2	xxxxH	LSB (bit[15:0]) of the program entry point
6	wLength	2	0000H	Not in used

Table 21-10 Vendor Request 5 Setup Command Data Structure

Offset	Field	Size	Value	Description
0	bmRequestType	1	40H	D7 0: Host to Device D6-D5 2: Vendor D4-D0 0: Device
1	bRequest	1	05H	VR_PROGRAM_START2: branch to target address directly
2	wValue	2	xxxxH	MSB (bit[31:16]) of the program entry point
4	WIndex	2	xxxxH	LSB (bit[15:0]) of the program entry point
6	WLength	2	0000H	Not in used

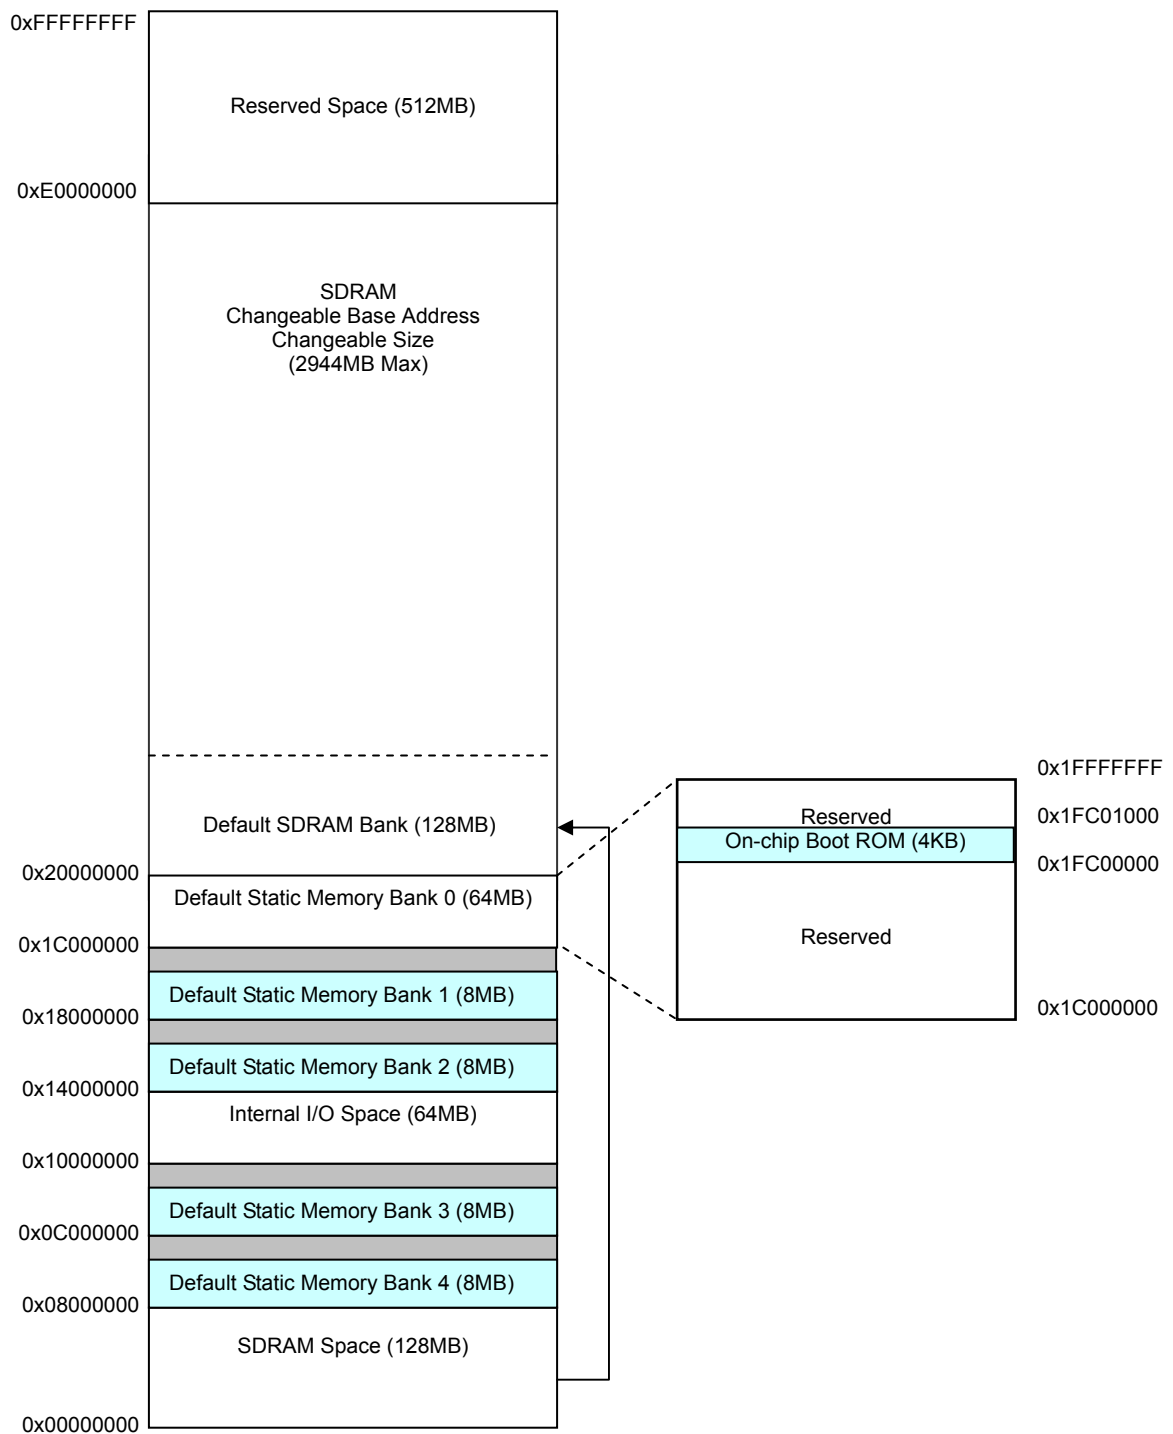

22 Memory Map and Registers

22.1 Physical Address Space Allocation

This chapter describes the physical address map, memory-mapped regions for every block in the JZ4725 processor. Both logical space and physical space of JZ4725 are 32 bits wide. The 4Gbyte physical space is divided into several partitions for external memory, PCMCIA and internal I/O devices. Table 22-1 shows the basic physical memory map:

Table 22-1 JZ4725 Processor Physical Memory Map

Start Address	End Address	Size (MB)	Function
0x00000000	0x07FFFFFF	128	SDRAM Memory
0x08000000	0x087FFFFFF	8	Static Memory, CS4#
0x08800000	0x0BFFFFFF	56	Reserved
0x0C000000	0x0C7FFFFFF	8	Static Memory, CS3#
0x0C800000	0x0FFFFFFF	56	Reserved
0x10000000	0x10FFFFFF	16	I/O Devices on APB Bus
0x11000000	0x12FFFFFF	32	Reserved
0x13000000	0x13FFFFFF	16	I/O Devices on AHB Bus
0x14000000	0x147FFFFFF	8	Static Memory, CS2#
0x14800000	0x17FFFFFF	56	Reserved
0x18000000	0x187FFFFFF	8	Static Memory, CS1#
0x18800000	0x1BFFFFFF	56	Reserved
0x1C000000	0x1FBFFFFFF	60	Reserved
0x1FC00000	0x1FC00FFF	0.004	On-chip Boot ROM (4kB)
0x1FC01000	0x1FFFFFFF	3.996	Reserved
0x20000000	0xDFFFFFFF	3072	SDRAM Memory
0xE0000000	0xFFFFFFFF	512	Reserved

The JZ4725 processor AHB bus devices are mapped at the addresses based at 0x13000000, and each device is allocated for 64KB space. Table 22-2 lists the complete addresses:

Table 22-2 AHB Bus Devices Physical Memory Map

Module	Start Address	End Address	Size (KB)	Description
	0x13000000	0x1300FFFF	64	Reserved
EMC	0x13010000	0x1301FFFF	64	External Memory Controller
DMAC	0x13020000	0x1302FFFF	64	DMA Controller
	0x13030000	0x1303FFFF	64	Reserved
UDC	0x13040000	0x1304FFFF	64	USB 2.0 Device Controller
LCDC	0x13050000	0x1305FFFF	64	LCD Controller
	0x13060000	0x1306FFFF	64	Reserved
	0x13070000	0x1307FFFF	64	Reserved
IPU	0x13080000	0x1308FFFF	64	Image Process Unit
	0x13090000	0x1309FFFF	64	Reserved
	0x130A0000	0x130AFFFF	64	Reserved
	0x130B0000	0x130BFFFF	64	Reserved
